To sum up this section: Searle defined 'conversational implicatures' as 'indirect speech acts' (Searle 1979, 30). Both Grice and Searle referred to the important aspect of why communication is understandable while the spoken sentence, the utterance, is incomplete. The differences between Grice and Searle emerged at this point. While Grice emphasized the importance of the speaker's intention, Searle focused on speech acts as a way of acting in communicative interactions. Grice's theory and Searle's 'speech act theory' can be reread as distinct theoretical approaches to a rational dialogue. Both imply a hermeneutic approach to communication, although they differ significantly regarding the role of speaker and hearer (Searle 1969). The use of language, that is, language activity or a language-game is at the centre of the question on how the meaning of a word evolves (see the next chapter).

One important consideration of this language approach is that every language-game is governed by the rules of life, that is, the use of language in the context and not by premises proposed by Grice. Therefore, rules are not external to the language-game. Such rules will derive their meaning within the language-game, that is, the communicative interaction and context.

One important result of the speech act approach to language, that is, to meaning and understanding, is that speech acts create institutional facts. Economic institutions – like other social institutions – are

designed, created, and configured by the language-based activities of society, which have to be acknowledged and accepted. Their existence depends on social acceptability and agreements. Economic institutions are created neither by natural procedures nor by ontological entities. Institutions have to be perceived for their existence, that is, they are dependent on social acceptability (Windeler 2001; Searle 1995). Institutional facts are defined neither by physical laws nor by physics.

According to modern language science and its founders, Humboldt, Wittgenstein, Austin, and Searle, we have to distinguish between ontological, or immanent, features and language constructed in the real world. I now turn to a different view proposed by Ariel Rubinstein.

4.4 Formal language versus everyday language

Rubinstein told us that the roots of his interest in language go back to his childhood, since he always wanted to understand the people's argument and talk, focusing on the link between formal language in model building, game theory, and everyday language. Rubinstein (2000, 3) wrote:

> I continued to explore formal models of game theory and economic theory, though not in the hope of predicting human behavior, not in anticipation of predicting the stock market, and without any illusion about the ability of capturing all of reality in one simple model. I am simply interested in the reasoning behind decision-making and in the arguments people bring in the debates. I am still puzzled, and even fascinated, by the magic of the links between the formal language of mathematical models and natural language. This brings me to the subject of this lecture – Economics and Language.

Rubinstein's book provides many examples of his interest in language as a focus of decision-making by economic agents, game theory, and the development of formal models in the game theory. He refers to current discussions of formal modelling and how to interpret this formalism in terms of daily language. He stated that formal models are not improved by a transformation into daily language or words of common use, because formal language is not expressly in everyday language. There exists a gap between both. Rubinstein referred to Grice's work as being about pragmatics, a branch of linguistic studies. Rubinstein wanted to construct rules for a cooperative communicative approach concentrated on the speaker's intention and his aim to influence the outcome of communication. In order to investigate the hierarchy between speaker and hearer in the light

of game theory, Rubinstein reformulated the central concepts and notions given by Grice. The term implicature, then, provided the key argument in Rubenstein's approach to the economics of language.

One main topic of economic investigation is social interaction in differently designed relations and economic systems. Rubinstein explained that all economic agents are acting on the basis of language capability, making decisions and forming judgments. This statement is beyond the trivial, since there is another player in economic theory, one who is accustomed to building mathematical models which are regularly interpreted by common language. This, importantly, 'derives from interpretation, which is expressed using daily language' (Rubinstein 2000, 5).

The focus of Rubinstein's interests is the development of formal model in game theory and its link to natural language. As he (2000, 5) puts it precisely:

> Much has been written on the rhetoric on economics in general; little however, has been written on the rhetoric of game theory. The starting point of the discussion is that an economic model is a combination of a formal model and its interpretation. ... I argue that the rhetoric of game theory is more 'useful' than it actually is, and that a better interpretation would make game theory less relevant than is usually claimed in the applied game theory literature.

By this reference to rhetoric, Rubinstein emphasized the distinction between formal models and language. Finally, for him language is part of formal modelling. He refers to Grice's work as an explicit contribution to game theory.

Two main questions are raised by Rubinstein to describe his approach to economics by language. Firstly: 'Why would economic theory be relevant to linguistic issues?' Secondly: 'Why would economic theory be a relevant subject of research from the point of view of language'? (Rubinstein 2000, 4). Rubinstein answers the first observation that economics deals with 'non-physical regularities in human interaction' which are based on 'natural language'. This notion was of great relevance for Grice and the understanding of the dialogue between speaker and hearer. Pragmatics has been influencing the theory of action, rules, and convention. Rubinstein (2000, 6) explained:

> Pragmatics searches for rules that explain the difference in meaning between a statement made in a conversation and the same statement when it is stated in isolation. Grice examined such rules in the

framework of a conversation in which the participants are assumed to be cooperative. Here, game-theoretical analysis will be used to explain a certain phenomenon found in debates.

In Chapter 3 of his book, Rubinstein outlines why the approach given by Grice is of relevance for this investigation of economic decision, debates, and structure within the framework of game theory analysis. To summarize his view: he supported the approach made by Grice. He interpreted the speaker's utterance as a signal which transfers information already given (Rubinstein 2000, 37). The way the hearer interprets the speaker's intention and how the speaker defines the assumptions addressed to the capability of the hearer are important factors for the understanding of an utterance. In game theory such matters as how an utterance would be interpreted commonly or be understood is to be viewed as an output of a game between speaker and hearer. Rubinstein stated that the only 'real phenomenon' of game theory is the term *debate*. A linguistic approach to game theory could provide more clarity on the linguistic meaning. For instance, the term 'debate' depicts a situation in which two persons do not agree and which provides a framework for them to explain themselves in order to possibly achieve an agreement.

Understanding refers to the complexity of the propositional attitudes of the speaker. Propositional attitudes express the speaker's intentions, opinions, expectations, experience, or thinking. It had been a long-lasting controversy in the literature as to whether it is possible to make a distinction between the meaning of a sentence or word and propositional attitudes.[11] For instance, in the 1950s Quine wrote a famous criticism of the traditional analytic/synthetic distinction, referring to the 'two dogmas' of empiricism. Later on, Quine overcame his previous view and regretted that in his early writings he had overlooked that it is not possible to set a border on meaning by semantic or linguistic rules, on the one hand, and by experience, on the other.[12] The results of an experiment have to be explained in sentences which are not created by the experiment itself. Moreover, there exist no particular experimental sentences or words which are developing with the experiment itself (Quine 1953, 1991). The experimental procedures and its results have to be expressed in public language.

Quine put forward a hypothesis of 'inextricability' by stating that it is not possible to differentiate between pure meaning independent of the praxis or the context in which the word is used and the propositional attitudes. 'Inextricability' emphasized the inherent connection among

meaning, context, and information. The implication of 'inextricability' can be understood if we consider how children learn the meaning of a word or a sentence. For instance, the word 'chair' is not learnt by looking into a catalog. The meaning of a chair is learnt by its use in practice. A child learns how to use the chair to sit or to stand on in order to enlarge its horizon. It learns how to put chairs around the table and how to move a chair in order to create another goal for its use in the context, or to remove the chair to change the game. It does not learn the meaning of a chair as a synonym for an object or piece of wood which possesses at least four legs. It is not possible to draw a rigidly fixed border between a so-called pure meaning and the knowledge of the use of language 'chair'. There exists no pure theory of the meaning of words or sentences beyond the practice of the language in use (see Chapter 5).

Quine later followed Wittgenstein's and Humboldt's research, accepting that there exists no boundary between the sentence which describes an experimental result and the sentence which refers to the theory. Nowadays, the dogmatic view of a dichotomy of experimental or empirical versus theoretical sentences is no longer relevant.

The consequence of the abandonment of this analytic/synthetic distinction was the acceptance of holistic and hermeneutic approaches to meaning. These approaches to meaning imply the acknowledgment that there is no boundary to be drawn between different kinds of sentences in describing data, observations, experiments, information, meaning, opinion, or utterances. For example, Davidson, who adhered to Quine's later view, argued that for the sake of a coherent interpretation of the speaker's utterance we have to recognize the conditions the person has taken into consideration to assess on the truth of a sentence. There are two factors to be mentioned: the beliefs or persuasions of that person who decides and the meaning of a speaker's utterance. Which persuasions, beliefs, and meaning (opinion) we are going to credit to a person depends on our *interpretation* of the speaker's utterance. Davidson applied the holistic view to his theory of 'radical interpretation'. Our interpretation of the speaker's utterance also depends on the meaning or opinion we have attributed to him or her. A particular characteristic of the holistic view of meaning is that all theories of meaning have been evolving against the background of scholarly experiences. Therefore, if this experience and the explanatory power of an analysis contradict the theory, one has to asses which elements of the theory must be revised or rejected.

4.5 The use of language as coordinative acting

> This is so much the conventional way of thinking about language that it is sometimes hard to imagine that it might not fit reality. (Lakoff and Johnson 1980, 459)

The discussion on central bank communication refers to 'convention' or the coordinative function – the coordination channel of communication (see Amato et al. 2003) – in order to try to explain why language matters in the economy. As was outlined in the previous section, Grice (1989) also stated that conventions imply 'what users of the sign do mean'. This brings us to Lewis's contribution, which at the initial stage of the debate provided a conceptual view on convention (Muchlinski 1998b). Lewis (1969, 2) objected to the view that convention and language are connected in a particular way:

> It is a platitude that language is ruled by convention. Words might be used to mean almost everything; and we who use them have made them mean what they do because somehow, gradually and informally, we have come to an understanding that this is what we shall use them to mean. ... To say only this is not to say much.

Lewis thus tried to explain how and why conventions evolve and what role is left to language. Lewis (1969, 2) also objected to the view that conventions are based on agreements:

> We have no concept of convention which permits language to be conventional (ibid). ...
>
> The conventions of language are a myth. The sober truth is that our use of language conforms to regularities – and that is all.

What are the roots of conventions? Lewis argued that conventions are modes of regularities of behaviour. Lewis referred to different means by which different people aim towards a common goal. Such efforts should be called communicative interactions. Given the assumption that the use of language conforms to regularity, Lewis assumed the 'use of language belongs to a class with a conspicuous common character: situations I shall call *coordination problems*' (Lewis 1969, 5). Lewis outlined that any social interaction implies a communicative action as a form of coordination, hence the use of language concerns coordinative actions.[13]

To be brief on this premise of Lewis, conventions arise out of the regularity of people's behaviour. The coordinative interactions are a kind of communicative action. They are the means of a coordination game in

terms of the game theory approach. Lewis, then, defined a coordinative action as based on common interests to serve common purposes. The assumed common interests lead to a further premise of the rationality of coordinative acting. For instance, agent (A), then, expects a common interest with agent (B) and, hence, is willing to coordinate and interact with (B). This assumed coincidence of will also implies the coincidence of the expectations of (A) and (B). This premise is required for realizing the common goal of communicative interactions, that is, in terms of Lewis's view, the coordination. Lewis (1969, 6–7) illustrated his approach to convention by the following examples, referring to Hume's *Treatise on Human Nature*:

> Suppose you and I are rowing in a boat together. If we row in rhythm, the boat goes smoothly forward; otherwise the boat goes slowly and erratically, we waste effort, and we risk hitting things. We are always choosing whether to row faster or slower; it matters little to either of us at what rate we row, provided we row in rhythm. So each is constantly adjusting his rate to match the rate he expects the other to maintain.

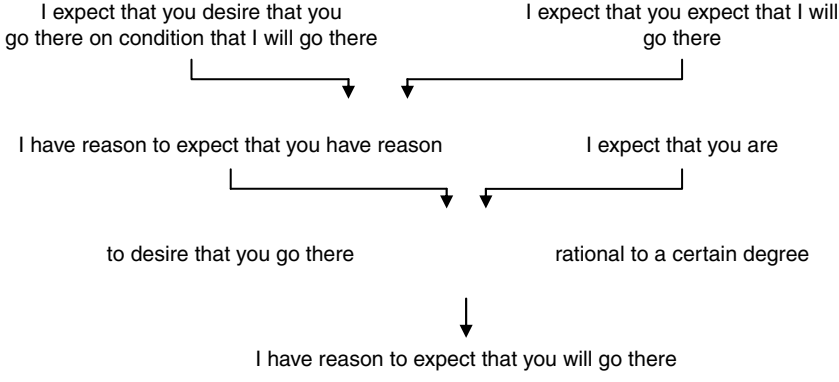
Lewis discussed examples with more than two people: for instance, campers in the wilderness or a car driver on the road. The involved agents will be only successful if they acknowledge their dependencies by working on a coincidence of common interests and also the coincidence of will, expectations, and goals. Since Lewis denied that conventions are based on an explicit agreement in advance, he went on to expound that any pattern of the coordinative interactions is based on the regularities themselves. These regularities of behaviour work like a natural force. It is the rule which guides the agents through the game in order to fulfil their common interests. Lewis, then, defined common interests of the agents and the emergence of a congruent goal, the coordination as an equilibrium referring to the principles of game theory (see Lewis 1969, 14). A common purpose requires coordinating the actions of agent (A) and agent (B) regarding their mutual expectations. A coordination problem, then, exists in a case of distinct alternatives of actions. Lewis defined a coordination problem as follows:

> Coordination problems ... are situations of interdependent decision by two or more agents in which coincidence of interest predominates and in which there are two or more proper coordination equilibria. (Lewis 1969, 24)

Decision-making is not required in cases of common interests. The presumption of common interests implies the double coincidence of wants. Lewis assumed that coordinative acting will be better the more it is based on mutual expectations of both agents (A) and (B) or among a group of agents respectively. This assumption serves the readiness of the agents to build up 'concordant mutual expectations' (Lewis 1969, 25). Lewis gave the following example: 'I may go to a certain place because I expect you to go there, while you go there because you expect me to' (ibid). What is needed, then, is an agent's confidence in the expectation-building process in which she or he is involved and the certainty that she or he expects the other agents to be involved, too. The involved agents are motivated by their common interests, expectations, and confidence, hence motivated by the behaviour of others. At this point the common knowledge assumption comes into consideration again. As is already outlined, the common knowledge assumption has a prominent place within economic theories. This presumed strong interrelation of the agent's expectations can be described as the expected expectations of all expectations.

> I said earlier that coordination might be rationally achieved with the aid of concordant mutual expectations about action. ... Coordination may be rationally achieved with the aid of a system of concordant mutual expectations, of first or higher orders, about the agents' action, preferences, and rationality. (Lewis 1969, 33)

This first order is illustrated in Figure 1:



A coordinated solution of an interactive process among different agents is provided by the recognition of mutual expectations. It is a replicate process of reasoning with one's own knowledge and beliefs based on different orders of assessment and reasoning. Lewis described this assessment as 'a process in which *one* person works out the consequences of his beliefs about the world' (Lewis 1969, 32).

To assess the expectations of others requires considering one's own expectation in relation to other agents' views. This is not an easy task, but can be accomplished by a mechanism. As Lewis (1969, 27) pointed out:

> If I know what your believe about the matter of fact that determine the likely effect of your alternative actions, and if I know your preferences among possible outcomes and I know that you possess a modicum of practical rationality, then I can replicate your practical reasoning to figure out what you will probably do, so that I can act appropriately.

This replication of a person's reasoning is based on the mutual interdependence of actions and the mutual expectations of the agents. Lewis, then, tried to strengthen his argument of a coordinating acting. How can agent (A) reach the point of a certain confidence in the behaviour of agent (B)? It is rational for agent (A) to get as much as information as possible about the prospective actions and the underlying expectations of agent (B). This information will serve as a guideline to orient his own actions and expectations of (B). Lewis focused on the interrelated procedure and mutual perception of expectations of (A) and (B), and also on implications the 'expected expectations' of the other agent regarding one's own expectation might have. This coordination approach can be described as a cognitive and acting procedure. Person (A) has to find out what person (B) expects him or her, that is, person (A) to do. Therefore person (A) needs to figure out the information in order to solve the coordination problem. Any reasoning by person (A) about the other person's (B) expectations or beliefs or actions will be replicated by person (B) and so on.

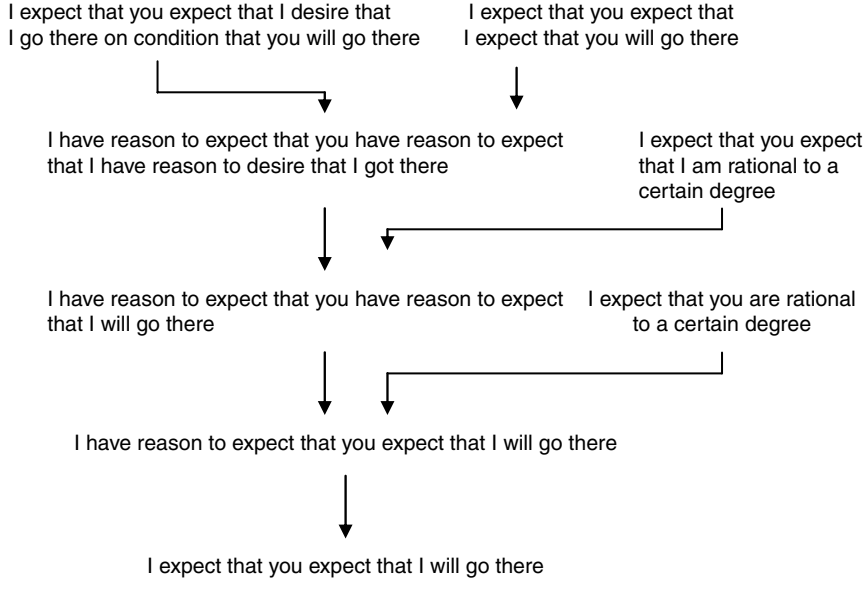
This procedure of mutual recognition cannot be modelled as a linear causality. The consequence of this is: person (A) might expect person (B) to try to replicate the attempt of (A) to replicate the attempt of (B) to replicate the reasoning of (A). Therefore the chain of reasoning or the mutual process of replicate reasoning will not end after person (A) expects person (B) to realize something. This process of reasoning about the reasoning and also about the ongoing replicate reasoning of others will continue before it has to be stopped by decision-making. Lewis (1969, 28) stated:

> Before things get out of hand, it will prove useful to introduce the concept of higher-order expectations, defined by recursion thus: A

first-order expectation about something is an ordinary expectation about it. An (n +1)th-order expectation about something (n>1) is an ordinary expectation about someone else's nth-order expectation about it.

Lewis described the mutual recognition of mutual expectations as a process of balancing different phases of judgment and reasoning according to the capacity to work out information and unambiguous perceptions. It is a procedure to discover the unambiguousness of a given situation. Furthermore, it is the evaluation of expected-expectations as a kind of rational reasoning. This premise of rational reasoning does not impose the commitment to act rationally, but rather it provides the possibility that agents will be able to understand. This process of replicate reasoning is not a back–and-forth linearity between two persons. Moreover, the process of reasoning is an outcome of 'a process in which one person works out the consequences of his beliefs about the world' (Lewis 1969, 32).

The high-order expectation or the replication of person (A) of the replication of person (B) is sketched in Figure 1 (ibid, 29–30): Person (A) expects person (B) to expect (A) to go to a certain place to meet one another. The expectations of (A) according to (B)'s expectations arise out of the procedure of the replicate reasoning of (A). With respect to Figure 1, Lewis stated this comparison is only perceivable as an



approximate one and, hence, as a consequence of acting. Therefore agent (A) will be able to build up a hierarchy of both his preferences and of (B)'s preferences, including the underlying rationality of both acting. The coordination problems can therefore be solved by the effort of concordant mutual expectations of actions. 'Coordination may be rationally achieved with the aid of a system of concordant mutual expectations, of first or higher orders, about the agent's actions, preferences and rationality' (ibid, 33).

What role is left for circumstances in Lewis's thinking? Circumstances serve as a framework to judge the expectations of other agents. Agent (A) assumes that (B) will act like he or she acts. However, circumstances indicate merely a certain pattern of regularity of behaviour. Lewis argued that the better the circumstances are perceived by the agents the more they will support the agent's procedure being justified in forming mutual expectations. The premise of perceiving another's expectations also implies the perception of one's own expectations. Lewis explained the process of judging one's own expectations and preferences, as well as grasping the expectations and preferences of other persons, as a concluding argument. The knowledge of conventions is linked to modes of actions. The coordinative process implies that conventions are to be perceived as a shared or 'common' world.

Lewis explained 'common knowledge' as a state of affairs. He defined common knowledge as the requirement, that is, as a constituent for any successful coordinative action (Lewis 1969, 61). To Lewis, the common knowledge assumption is constitutive for the evolution of conventions. Moreover, it provides a strong prerequisite needed in order to achieve the common interests of both agents (A) and (B) or group agents.

According to the common knowledge assumption and the definition of conventions as a regularity of behaviour, agents guide their present solution based on the knowledge of comparable problems of coordination and its successful solutions (see Geanokoplos 1992, 54). Interacting, coordinating, and aiming at a common goal are based on common knowledge and regularity of behaviour. This premise of conformity is literally renewed in any action and interaction iteratively. Lewis assumed that our knowledge of analogies motivates the regularity of our view of other agents, their expectations, preferences, and modes of acting. As assumed by Lewis (1969, 41), taking note of these regularities of behaviour supported a general premise:

> We come to expect conforming actions not only in past cases but in future ones as well. We acquire a general belief ... that members of a

certain population conform to a certain regularity in a certain kind of recurring coordination problem for the sake of coordination.

The explanation of the evolution of a convention now is clear: it is the recurrence of past events or the 'conspicuous analogy' which stabilize our expectations. Since all agents rely on this precedent of stabilized expectations in future situations, such a regularity of behaviour works as a stabilizing rule. 'Our defining conditions for the existence of a convention consist of regularity in behaviour, a system of mutual expectations, and a system of preferences' (Lewis 1969, 58).

How is it possible to perceive the expectations of other agents? In Lewis's view, the expectations, willingness, and preferences are perceived by acting. Common patterns of perception lead to a common procedure of building expectations, which conforms to a certain pattern of regularity of behaviour. Knowledge which enables agents to act is defined as knowledge of acting. Lewis stated that such capability should be seen as knowledge proper. His statement that 'knowledge (is) confined to particular instances' sheds light on an important implication of his approach to convention, because following a convention is only applicable to a particular situation and not to be understood as a general rule. The concept of convention encompasses the situational approach. The consequence is that 'any convention is arbitrary because there is an alternative regularity that could have been our convention instead' (Lewis 1969, 70).

Agents have to decide which convention should be chosen regarding the situation. Lewis (1969, 78) defined convention as follows:

Box 2

A regularity R in the behaviour of members of a population P when they are agents in a recurrent situation S is a *convention* if and only if it is true that, and it is common knowledge in P that, in almost any instance of S among members of P,

(1) almost everyone conforms to R;
(2) almost everyone expects almost everyone else to conform to R;
(3) almost everyone has approximately the same preferences regarding all possible combinations of actions;
(4) almost everyone prefers that any one more conform to R, on condition that almost everyone conform to R;
(5) almost everyone would prefer that any one more conform to R', on condition that almost everyone conform to R', where R' is some possible regularity in the behaviour of members of P in S, such that almost no one in almost any instance of S among members of P could conform both to R' and to R'.

What does a 'recurrence situation' mean? It is to be interpreted as a situation in analogy. The reference to the population (P) in the above definition makes clear that any possible ambiguities and discrepancies are not expected to be great ones. Lewis sketched a common background of society for the agents in interactions. It includes a kind of common pattern of perceptions and actions. The term convention gets its meaning by its uses in different contexts.

The pattern of perceptions and the modes of interaction are guided by the conventions of a certain population and context. This particular context and the involved population give place to the use of language in actions. As Lewis (1969, 177) explained:

> We are trying to find out what the members of a population P must do in order to make it the case that a certain possible language *L* is their actual language – that they use *L*, in the sense we are after. It is surely something they do in conformity to a convention: something everyone in *P* does because he expects his conversational partners in P to do it too, and because a common interest in communication leads him to want to do his part if they do theirs. This much we know, just because we know that it matters little (in the long run) which language we use, so long as we all use the same one.

Lewis linked contexts, people and language. Lewis's model provides an explanation of the evolution of convention and how it takes place within a group of agents. With respect to the function of the population, one can argue that Lewis gave place to the meaning according to different situations and actions.

Nevertheless, the functions of language are not explicitly expounded in his model. As the quotations at the beginning of this inform us, in Lewis's view language emerges to solve a problem of coordination. Lewis described language as a medium of transporting information or signals from the sender to the receiver. He presumed the identical sense or meaning of any sentence. To put it more precisely: the agents exchange a given meaning. This contradicts the supposition of arbitrary convention. Lewis explained the success of communicative interaction as the outcome of any speaker's utterance. In his model of communicative interactions, the language of conventions is interpreted as a regularity of behaviour in order to develop the speaker's utterances, which guide the reactions by the listener. Lewis, then, maintained the success of the sender-receiver relation regarding the intention of a successful cooperation.

Here we find the analogy to Grice's concept of meaning. Like Grice, Lewis developed his notion of convention on the basis of a model of acting. Thus the actions can be viewed as a mirror of both the intentions (Grice) and the expectations (Lewis). Lewis, then, elucidated that actions are often done with definite intentions. An agent's intention can be reconstructed by the action of this agent. This brings us to the key aspect of Lewis's model: conventions provide a reliable pattern of behaviour.

Any communicative acting resembles different expected patterns of behaviour of different agents that can be interpreted in a conventional way. Within such a situation the expectation of behaviour relies also on communicative, social, and grammatical modes. Therefore, it is not possible to argue that the implementation of a communicative action is identical with following a regularity of behaviour. The success of communicative actions depends not on an exchange of given meaning, but on the evolution of the meaning through communicative acting. While the communicative action is a certain feature of the complexity of language-games the communicative action itself cannot be interpreted as driven by regularity in behaviour – a convention – as defined by Lewis.

Lewis tried to expound on the evolution of a convention regarding the mutual recognition, interest, will, and expectations of the involved agents. Lewis failed to explain how the listener's understanding could be based on the conventional approach. In the end, the listener's understanding is determined by the speaker's intention. Lewis followed the traditional theory of communication and the 'conduit metaphor'. Lewis did not explain the functions of language. Both speaker and listener have to assess the signs, symbols and words because there is no objective meaning of signs, symbols and words. The language itself works as a mode of coordination. Lewis also stated that a population chose a language. This is not convincing, since language is not a commodity or thing which can be chosen to be consumed.[14] At this point I should ask: What role is left for language in Lewis's model? What does it mean for language to conform to regularities? Language is a verbal signal. Any coordinative acting is based on communication. Lewis stated: 'A population's common use of some one language ... is a convention' (1969, 49). It does not matter in which language person (A) and (B) communicate so long as both use the same language. Davidson (1998) objected to this hypothesis by stating that understanding does not root itself in a shared language.

Lewis stated that the wish to be understood leads directly to 'media of exchange'. He referred to economic discipline and explained that

the coin of a particular realm is such a medium of exchange. How had the acceptance of that coin as a medium of exchange been achieved? Lewis argued that the acceptance of a medium of exchange is rooted in our conventions. We would accept this medium as a mode of return or reciprocity. It is obvious that acceptance is not given by the object, the coin, but rather by a state of confidence. Lewis agreed that it is certainly not a convention to use a language. Using a language is a convention and, therefore, a regularity in behaviour. A convention does not guide the behaviour of the population in every detail, but rather a convention restricts behaviour. 'Here I will say only that it is a regularity restricting one's production of, and response to, verbal utterances and inscriptions' (Lewis 1969, 51). He stated, 'conventions are like fires: under favourable conditions, a sufficient concentration of heat spreads and perpetuates itself', that is, a convention is a regularity in behaviour (Lewis 1969, 88). If a population has the choice between two possible languages, it follows from this that 'it must be by convention that a population chooses to use one or the other', concluded Lewis (1969, 50). In my view, Lewis missed the point of the use of language. It is not possible to choose a language like an apple. His view that 'language conforms to regularity' denies the constitutive role of the use of language in practice. It is for this reason that Lewis's view is not an accurate approach to central bank communication.

5
Language, Expectations, and Circumstances

> Our talk gets its meaning from the rest of our proceeding.
> Wittgenstein 1979, § 229

In this chapter I would like to provide an introduction to language as opposed to a coded language. This chapter tries to show why understanding matters to central banking. According to modern central bank literature, the genuine task of a central bank is to steer market expectations. Since expectations and the expectation-building process are not to be regarded as mental states but rather as articulations (utterances) configured by language-based interactions in different circumstances, central bank talks matter. However, expectations are neither linearly determined causal responses to stimuli nor causal connections to disclosed information. Economics, as a social science and as institutionalized procedure, is not based on causality as is typical for mechanical stimulus-responses. This is also true regarding understanding.

As we have seen in the previous chapter, Grice presupposed that meaning is analogous to the intention of the speaker. Moreover, as a general rule he differentiated between the meaning of the speaker and listener. The 'standard meaning' is seen as abstracted from communication interaction, that is, it is not based on social interaction but rather incorporated in symbols, signs, and words. Although Grice tried to step out of the classical theory of meaning with the term 'act-object-ambiguity' – that is, meaning as incorporated in mental states, intention, or in an object itself – he remained focused on the speaker's intention because he emphasized intention as an analogy of speaking and acting. As Grice stated, the 'effect' of a communicative acting should be ruled out by the listener. The listener has to reconstruct the speaker's intention.

Lewis demanded a rule or convention, such as common knowledge, for communicative interactions. Lewis stated the common knowledge assumption is necessary as a rule both to coordinate and to create a convention. Language acquires its role through 'conforming regularities' of behaviour and, hence, understanding is seen as rule-following. The aspect of understanding has been neglected by both Grice and Lewis. From my point of view it is not beneficial to rely on rules or a coded language, since understanding is neither a result of a stimulus-response mechanism nor of deciphering. A coded language could probably work within a stimulus-response mechanism among agents and machines in order to set a machine in motion. However, such a stimulus-response mechanism is not a model to capture and understand the communicative interaction between a central bank and agents of the financial markets. The analogy of human behaviour to a machine misses the point of economic interactions in the financial markets, not only because of the different time horizons but also because of the interdependency of these actions according to monetary policy being worked out through markets.

The view to set agents in motion by a coded language, like a struck billiard ball, is misleading. To understand how monetary policy works through markets, one needs to acknowledge the processes perception and understanding of the central bank talk and communication within markets involving many different agents in different markets. Any attempt to guide market expectations by a coded language implies a risk of a significant disappointment of such agents if, for instance, the central bank has to change its policy in response to the changing circumstances, that is, changes in the context and environment. The more a central bank tries to avoid such misunderstandings through a commitment to communication via a coded language, the greater will be the risk of generating misunderstanding among market agents.

To acknowledge understanding as part of the communication strategy implies stepping beyond presumptions about the intention or mental state of the speaker. Understanding cannot be conceptualized as rule-following. Rules must be applied to something, such as 'the rules of car-driving'.

Understanding is not to be reduced to deductive or inductive reasoning – those procedures based on certain regular features. As a judgment at hand, it does not follow procedures of decoding or a cybernetic exchange of information. It is an attempt to come to terms with a problem or event.

Understanding – also degrees of understanding – are an epistemic consequence insofar as I am changing my knowledge about circumstances

immediately. I cannot interrupt the understanding. Understanding is not a mental status but rather an ability to participate in circumstances differently. However I could maintain not understanding anything. Understanding is hypothetical or inferential reasoning. Understanding is related to the complexity of sense or context, which includes knowledge of the world and acting, which means participation in a shared practice. This shared practice encompasses also the knowledge of others whom I perceive in communicative interactions. Keynes explained it as an 'average opinion' (see Section 2.3.2). Wittgenstein (1983, 334) described it as participating in a 'language game' by articulation: 'A game, a language, a rule is an institution.' A language-game is an appropriate concept to capture and describe the communicative interactions between a central bank and financial markets.

I am going to explain why, according to Analytical Philosophy and modern language science since Vico, Herman, Herder, Humboldt, Kant, and Wittgenstein,[1] the meaning of utterances or articulations are inherently embedded in the communicative interactions, hence in their context (Muchlinski 2006).[2] Their view does not support the approaches Grice and Lewis had proposed. The meaning of signs, symbols, and words is not rooted in itself. It is impregnated by its use in different circumstances. From the view point of Analytical Philosophy, the intention is not the sum of the mental state of an individual. It is to be seen as the realized action. Therefore action is perceivable as activity or communicative interaction respectively; there are no two things like (a) intention and (b) action.

As Humboldt (1836/1998) explained, on the basis of his comprehensive language studies on the differences in world languages, language is '*Thaetigkeit* [*energeia*]' activity (Trabant 1986). Language as activity implies that the meaning is embedded in different patterns of language in action. Language is not a label for mental states, intention, or thoughts because language is not neutral towards meaning. Humboldt et al. have revolutionized our view on language by emphasizing that language has a constitutive function in the creation of meaning and circumstances. In contrast, the traditional philosophy presupposed the (speechless) 'idea of mind' (Aristotle, Locke), and that mental states, intentions, or thoughts are created independently of language. According to this view language works as a symbol, sign, or word and has the function of post-labelling thoughts, intention, or mental states. Thinking comes first, speaking follows.

However, as the criticisms of Analytical Philosophy go, single words, symbols, or signs do not configure the meaning because it is the

surroundings of a communicative interaction and the structured relations of the words in use which create the meaning. It is contradictory to assign language a constituent function and simultaneously assign the description of the world to words or concepts as images. Wittgenstein developed Analytical Philosophy further, and this has been accepted in the modern view of language science (Günthner and Imo 2006; Fiehler et al. 2004). He related everyday language to 'forms of life': 'To imagine a language means to imagine a form of life' (Wittgenstein 1978, § 19).

> Meaning is not a process which accompanies a word. For no *process* could have the consequences of meaning. (Wittgenstein, *PI*, II xi, 218)

A word does not acquire its meaning as an isolated or illuminated point. As was said in the introduction, the use of a sign, symbol, or word gives life to it (Wittgenstein *PI* § 432). However, the current research on central bank talks and communication looks to the use of single words or code words in the speeches, minutes and publications of central banks in order to decipher the meaning of the information (Berger, de Haan, Sturm 2006).

Let us pause here to consider economic circumstances: how are they created? Let us consider for instance the financial crisis which started at the end of 2007; it can hardly be denied that many of the so-called financial 'products' in question – a variety of derivates which contained the promise of future earnings – a promise of payment, (see Akerlof and Shiller 2009) – were created by the use of language; they were not ontologically supplied as things. However, it was possible to create these financial products within certain economic environments through certain communicative interactions, based on certain expectations, beliefs, persuasions, or, as Wittgenstein would have described it, as 'language-games' among the agents in markets. Keynes also described language-games in economics:

> For it is, so to speak, a game of Snap of Old Maid, of Musical Chairs – a pastime in which he is victor who says 'Snap' neither too soon nor too late, who passed the Old Maid to his neighbour be fore the game is over, who secures a chair for himself when the music stops. The games can be played with zest and enjoyment, though all the player know that it is the Old Maid which is circulating, or that when the music stops so me of the players will find themselves unseated. (1936, C.W., VII, 156)

Communicative interactions create economic circumstances and, hence, 'economic facts and fictions'. Central banking as acting through markets needs to recognize the epistemic presupposition of a successful

communication. A central bank has also to acknowledge the constitutional conditions of the knowledge of participants in the markets or the knowledge of the society. This includes the history of the use of its key terms and concepts. A central bank's action in financial markets is embedded in its historical experience, as King (2004) explored in his studies of central banking, money, and inflation in Japan and Brazil.

5.1 Benefits and risks of a coded language

This section deals with certain characteristics of a coded language, its benefits and risks. I would like to give a short summation of some important questions and answers here: What is, after all, a coded language? Certain characteristics of coded language will be explained and the term itself defined in the following paragraphs. Where does the meaning of a coded language come from? It results from a defined rule. What is the implication of making reference to a coded language? The implication is the presumption that circumstances do not change and that the meaning is incorporated in symbols, signs, and illuminated words. Does a language code simply rule how to react to a stimulus? Yes.

Recalling the example of the car and car driver, it is possible to imagine setting certain limits in order to define the context of car-driving. It is also possible to define it by making a list containing all the elements contained in that context: roads, maps, cars, light, rules of traffic, wheels, steering wheels, spark plugs, fuel, and so forth. As this example indicates: A coded language is rooted in an exact definition and in a defined area or field. There is no vagueness or ambiguity in its meaning. A coded language can be explained by a list of all the distinguishing marks or features which provide an invariant context and situation. The meaning of a code is given ahead of its use. A coded language maintains a sense by itself regardless of any further interactions between the authors, agents, or institutions. A coded language is incorporated as a fixed rule or in a logical structure which is itself defined independent of changing environment and context. It is like the traffic light based on the simple rule. It does not create specific institutional facts or respond to their changes. A coded language is rooted in a certain system of definition. It makes sense to use a coded language in an invariant environment composed of and, indeed, designed using mechanical rules. A coded language – like the instructions on how to use a car or a machine – can in effect only be anchored in an invariant environment – for example, regardless of whether one drives on the left or the right. The context of an instruction on how to use a car is stable.

The car is defined by certain mechanical properties. Instruction on how to understand a coded language in order to get a driver's license demonstrates how the use and understanding of a coded language differs from everyday language. This generates a particular behavioural pattern which is necessary to avoid crashes of cars by establishing a strictly regular order applying to car drivers. A coded language is not embedded in a history, or at least not in one which reflects the dynamic, ever-changing and newly conditioned interactions. A coded language is not, in that sense, an echo of past events. Since a coded language is not rooted in interaction and practice, it is an artificial language. Words separated from a particular environment or set of environments lack any useful meaning. Here we can see the reason why a coded language is free of ambiguity and vagueness, which seems to be beneficial for economics and central banking because of their particular methods, which focus on quantifying, measuring, and forecasting.

Considering the essential characteristics of the modern view of central banks working *through* markets, how then could a coded language be a link between heterogeneous agents and the central bank? The problem of a central bank's talk based on a coded language is pointed out by Issing (2005a, 70):

> Code words can be readily identified and taken into account in market operations; they can reduce uncertainty in the run-up to meetings of the decision making body, and they can help to avoid errors in the short-term planning of operations and curb the volatility of interest rates. However, with the use of such code words, the central bank puts itself under pressure to honor a quasi-promise.

Karen Johnson, on the board of governors of the Federal Reserve System, argued that central banks need first of all to create a 'communication language. Currently, they tend to use very few words, often seen as coded language' (2001, 96). Johnson explained the problems which arise out of the use of a coded language:

> When these words seem to work with the target audience they are used over and again. But then, if the words differ only a little bit from one time to another, they may be mistakenly interpreted as a policy change. (2001, 96)

Indeed, the risks of a coded language are evident. Any conditional announcement regarding future decisions and actions implies both the

eventual necessity, and thus the risk, of a self-commitment with the consequence of greater inflexibility in action and reaction by the central bank. This reduced freedom to act and react also implies the risk of disappointing the market agents. Where a redirection of monetary policy is required, a central bank's announcement based on a coded language has, in any case, to be explained ex post facto in everyday language. A coded language which has to be explained subsequently in everyday language is not credible. People will not trust in it. Moreover, this reinterpretation diminishes the credibility of the central bank because its efforts to translate the coded language into everyday language will fail. In the light of modern central bank theory and according to the selective FOMC transcripts introduced in this book, we could argue that communication 'as the heart of both accountability and transparency' (Blinder and Goodhart et al. 2001) must be based on everyday language. A thorough and complete evaluation of the FOMC transcripts of the Volcker era will broaden support for this.

Any announcement or statement of the central bank can only be understood as an announcement regarding the mandate the central bank is aiming to carry out. A conditional announcement also points to particular eventualities governing a central bank's prospective actions not yet known. Since market actors tend to look for particular hints in order to make their own decisions, a coded language will in fact increase the problem of the central bank's inflexibility to alter its own decisions. An example is the abandonment of signal codes the European Central Bank declared in May 2007.

As I showed in Section 4.5, Lewis emphasized the characteristic of language as a rule with the statement *'language conforms to regularity'*. Admittedly, the creation of a rule of car-driving could be seen as an example of such regularity by language. The rule of car-driving will achieve its acceptability, not through the public's acceptance and acknowledgement, but simply by the mechanical procedure or by a specific DIN-norm. At this point any further analogy comes to an end. Car-driving – or using a machine – is not identical with creating a rule as a result of social interactions. We have to distinguish between rules which have been created socially that can be defined as institutional rules, on the one hand, and rules which conform to regularity, on the other hand. If we recall Lewis's view, he defines language-based acting as a rule and, hence, as convention. However, according to Habermas we need to differentiate between the social acceptability and validity of rules and rules based on mechanical analogy. Since language rules do not exist ontologically compared with something like a car, a

hermeneutic interpretation of language rules is needed (Scholz 2001). Acting as social acting in different circumstances is not directed in its meaning ahead of its use by focusing attention on existing rules listed in a catalogue. Social acting in different circumstances is not comparable with car-driving on different roads in different countries.

There is no doubt that a coded language can guide reactions in particular directions; for example, it can induce so-called iterative movements. A good example is the well-known metaphor of a 'run on the bank' (Bagehot 1873) which is, in effect, a self-fulfilling prophecy, and has caused many bank crises. There exists no doubt concerning the dangers of a situation in which coded language may guide mass behaviour, as the history of communication has shown (Lasswell 1935, 1948).

Whereas economic data always provide their own ambiguity, as chairmen Volcker and Greenspan emphasized, Chairman remark concerning the empirical findings seems to confirm the uncertainty. The chairman remained reticent when the data could not be read as a certain unambiguous description. The risk is evident that statements by the Federal Reserve Bank accompanying the interest rate move could lead to some unsettling signals in the long run. With uncertainty in the landscape, central banks – like other institutions – need to be anchored. The uncertainty would be intensified by the use of a coded language.

One particular benefit results from the assumption underlying a coded language: that the future of financial markets or the economy in general is capable of being conceived with greater clarity and less – or indeed no – uncertainty. The coded language appears to open an opportunity of interpretation by following a clear and unambiguous road map on the highway towards financial success. A coded language appears as a sure guide towards the best choice among financial or economic opportunities directly and, hence, supposes certainty in a world of uncertainty. This is illusory. From a car-driver's point of view, the end of his or her road indicates either the success of the way selected or at least its partial success. The expectations addressed towards the use of the coded language in central banking must, however, fail because the language activities of communication, meaning, and understanding are a complex task.

The presumption of a pregiven meaning of a word or sentence is, however, without doubt problematic, since the meaning is rooted neither in the intentions of the agents, nor in invariant situations. The classical view of communication neglects the functions of language, which is deemed to be neutral and, hence, a label, and communicative interaction as a principle for organizing and systematizing the ambiguity

which cannot be eliminated. The classical view of communication contradicts the modern view of language and cognitive sciences.

To achieve a meaning a word must be used several times in different contexts, practices, and circumstances. A coded language can not provide such a continuum of uses. If central banks try to act on the basis of a coded language they would adapt a given meaning of sentences independent of the context and the culture. This contradicts sharply the continuity of changing circumstances, contexts, and environments and therefore information as being subject to relationships. Moreover, it is meaningless regarding monetary policy strategy and the mandate of a central bank. In contrast to a coded language, language in use is neither a number nor a calculus which can be measured, weighed, and counted in order to give meaning to it. As Wittgenstein (1978 § 81) explained:

> We often compare the use of words with games and calculi which have fixed rules, but cannot say that someone who is using language must be playing such a game. – But if you say that our language only approximate to such calculi you are standing on the very brink of a misunderstanding. For then it may look as if what we were talking about were an ideal language. As if our logic is so to speak, a logic for a vacuum. – Whereas logic does not treat of language; and as if it took the logician to shew people at last what a proper sentence looked like.

An ideal language or language as symbolism is not appropriate for the need of understanding as Wittgenstein (1958, 25) explained:

> When we talk of language as a symbolism used in an exact calculus, that which is in our mind can be found in the sciences and in mathematics. Our ordinary use of language conforms to this standard of exactness only in rare cases.

If this premise of non-ambiguity and non-vagueness bears relevance it might seem to be the best method for a central bank to communicate with different agents in the heterogeneous financial markets. The non-ambiguousness and exactness of a coded language should lead to an understanding without being in any way misleading. It also defines the mechanism of understanding in order to avoid a discontinuity of understanding or a discontinuity generated by misleading elements. Therefore, in a coded language vagueness and ambiguity of meaning

are excluded by definition or by deductive reasoning. Furthermore, the assumption underlying a coded language implies the maintenance of a correspondence of objects with their names and properties as unique, clearly defined, exactly measurable and, hence, objective and true.

After this short review of the risks and benefits of coded language, I would like to raise the question of why precisely a coded language restricts a central bank's methods and possibilities of reacting immediately and flexibly. In my view a coded language increases the uncertainty surrounding monetary policy because a coded language does not improve understanding and does not suit a changing environment as mentioned before. One has to ask whether these methods are sufficient to guide market expectations or not. Should a central bank not aim at attempting to enlarge its set of methods? As already sketched, current empirical studies enlighten us to the importance of real-time data, that is, press conferences which mitigate uncertainty in the economy.

A coded language is a simplified form of communication; it works like a numeric sign or symbol. Any approach to the economy as a simplified model overlooks the importance of different interactions and the need of the central bank to influence the expectation-building of different agents in order to achieve its mandate of price stability. If a central bank adheres to the 'car analogy', it could attempt to apply Lewis's view that 'language conforms to regularity' to the steering of market expectations. If not, a central bank should be aiming at a common understanding.

The activity of speaking, decision-making and expectation-building processes is surrounded by uncertainty. Any of the simplified models involving an analogy to a mechanical arrangement emanates from the classical model of communication in which language and interactions by the receiving agents are eliminated. As explained, the classical model pictures communication as involving the causality between two mechanical impulses. The implementation for a coded language conforms to a behavioural regularity with such an analogical framework.

Contrary to its assumed beneficial effects, the use of a coded language will in fact create and exacerbate situations of being misled and misunderstood in financial markets. A coded language is by definition an exact and a non-vague language, whereas everyday language is not. Mundane language is characterized by non-exactness and vagueness but, it must be noted strenuously, not its meaninglessness. Vague terms and concepts are not bounded, whereas codes are. However, the boundaries of a coded language do not have any relevance to the shaping and development of monetary policy in practice (Sainsbury 1996).

Acting means that agents shape contexts and also create new contexts by their ways of acting (Kober 2002). There is no choice of whether to acknowledge the uncertainty of central banking or not. With uncertainty in the landscape, central banking needed to be anchored. It is important to emphasize that a central bank's pattern of acting structures the particular reality, that is, the environment and, hence, the relations of market interactions. Meaning and understanding cannot be anchored in an artificial system. The use of code words or signal words by a central bank does not itself provide a deeper understanding of how and when the central bank is going to take action. To understand the central bank's deeds and words as a coherent procedure requires one to perceive the central bank's talk or communicative action as embedded in the long-run framework of its mandate.

In contrast to a coded language, the use of everyday language – the language in practice – configures a certain context understood by participants of the financial market and the central bank. As a pattern of acting and a way of articulation it is impregnated by the changes of the context. Taking into account the communicative interaction between the central bank and the financial market, this ambient environment is part of the management of affairs in the contemporary world. It is configured by the articulated interactions. Therefore, it is appropriate to refer to a language-game to provide a picture of the totality of the embedded actions, rules, conventions, implications, interpretation, and persuasions of such communicative interactions.

5.2 Formal language as coded language

> Language did not emerge from some kind of reasoning. (Wittgenstein 1978 § 475)

This chapter gives some more evidence as to why the use of a coded language is not an appropriate way of achieving a central bank's mandate. A coded language implies the elimination of the arbitrariness of colloquial language. This would necessarily also imply depriving the language of its function. As was outlined, a word possesses multiple characters regarding different contexts and uses. Some of the risks of using a coded language were explained in the previous chapter. A coded language is rooted in a logical system or in an artificial system. If a language is grounded in axioms or logical principles the link to reality fails.

Scientific procedures are in general defined as objective and, hence, controllable by others. Logic, mathematics, and deductive reasoning are

accepted scientific methods. For instance, the language design of logic is reflective, analytic, and controllable. Mathematics leads to general models and formal language constructions. Logic and mathematics are driven by deductive reasoning and calculations. Deductive reasoning seems to fulfil the scientific criteria for truth and objectivity. Deductive reasoning should provide and guarantee a non-ambiguity, exactness, and precision of results, that is, the meaning. A coded language should also fulfil this demand to eliminate ambiguity, vagueness, and contextual sensitivity of the meaning of terms or concepts. However, the projection of mathematical and logical theories or axioms onto the world of experience is beyond the model world and is primarily a metaphoric approach to experience (Stekeler-Weithofer 1999, 516). The language of models and mathematics cannot be applied to experience directly but, rather, as related by analogies and projections. 'Exactness is a property of a model or formal theory and therefore limited in its proper application on real experience' (Stekeler-Weithofer 1999, 512).

> Just as poetry expressed in rhymes by no means leads to greater credibility of the poem and thus to increased ease of memorization, so do axioms and deductive premises define the sense of deductive sentences.[3]

A striking example of this failure to build up a system of a coded language in analogy to a machine was the attempt of the formal approach to language at the beginning of the twentieth century as introduced by Bertrand Russell and the early Ludwig Wittgenstein.[4]

I want to return briefly to this because it shed light on the limits on working out a theory of communication interaction based on a coded language (Muchlinski 2006). At that time a generation of scientists had attempted to build up a formal language approach to reality. The motivation was to conceptualize a complete system of formal language which should delete all ambiguity, inexactness, and vagueness from everyday language. Persuasions and convictions were to provide a scientific language for scientific processes which should fulfil all the supposed criteria of those processes. A scientific process was expected to be free of any ambiguity, inexactness, and vagueness. Scientific research should be expressed in a particular language which possesses all the criteria of non-ambiguity, exactness, and precision.

Russell explained his analytical tools in his publications on mathematics, logic, and philosophy. Shortly after these publications he opened up a discussion concerning the problems on how the meaning

of a formal language could be stated. He addressed certain problems concerning the formal language approach to science and to reality. He tried to build up a system of a formal language or coded language. He rejected his own earlier view, that is, his demand on the non-ambiguity, exactness, and non-vagueness of language. Russell (1986, 176) developed his critique of his early view on language and logic as a reflection to modern research in physics by stating that there are no simple entities such as atomic propositions in language.

Such neat assumptions of a formal language approach to reality and science were doomed to fail because the assumption of simplicity and exactness, and the atomised structure of the propositions and their meaning were themselves merely a construct by the protagonists of a formal language approach. In his lectures 'on logical atomism' in Cambridge in 1918, Russell started out by arguing that a formal language works only as a private language. Russell then abandoned the logical atomism in his approach to everyday language immediately after his lectures in 1918.[5] He went on to criticize the presumed isomorphism of a formal, that is, ideal, language, and its reality. Russell also criticized the view of a private language which neither leads to a meaning nor to an understanding because it is not shared or used by other people (Craig 1997 in Hale and Wright 1997).

Wittgenstein's *Tractatus* was influenced by Russell's thinking, and it addresses logic, logical syntax, and their relation to reality. The early Wittgenstein analyzed the relation of language and reality as an external relation. He stated that thoughts, mind, and reality were conducted by the system of logic and logical syntax alone. He defined the world as a composition structured by simple facts, that is, by logical syntax. Like Russell before 1918, the early Wittgenstein also tried to develop an ideal language and ideal language system. Such an ideal language, able to provide an analysis of the world, should be a picture of reality based on the same logical structure. The syntactical structure of the sentences should logically represent the facts as found. Objects and properties are independent of the use of language and therefore given ahead. The language only pictures the thoughts.

Wittgenstein proposed two main branches in his early work (Wittgenstein 1961): firstly, the 'doctrine of atomism' and, secondly, the 'picture theory of meaning'. Both doctrines imply the superiority of formal logic or logical syntax over everyday language. The early Wittgenstein argued, 'because language disguises thought', it is necessary to build up a logical system to organize and structure the signs and the symbols of meaning (1961, 4.002; 5.64). At the time that Wittgenstein

was concerned with his writings on *Tractatus*, he was attracted by the suggestion that logical syntax could work as a universal law and, hence, frame the language. His conclusion at that time was that propositions derive their meaning due to the logical syntax.

His 'picture theory of meaning' was based on the supposed simple entities. He conceptualized the 'picture theory of meaning' as a formal language approach to language and reality. Wittgenstein differentiated between the 'elementary proposition' and a proposition as the key elements of that picture theory. Any proposition contains simple elements, that is, it consists of 'elementary propositions'. An elementary proposition is defined as the simplest part of the proposition, in its atomic structure. The picture is determined by the logical structure of the world. To judge the truth or falsehood of a proposition or situation will depend on the correspondence of objects to reality according to a logical structure. Consequently, the structure of the reality is compared with propositions and, hence, driven by the logical syntax.

The picture theory of meaning as introduced in the *Tractatus* is based on the view of an isomorphism of the formal language approach and reality. This isomorphism was also propounded by Russell until 1918. Wittgenstein developed his picture theory as a picture theory of logical substitution. The elements of the picture are called facts because of their logical arrangement vis-à-vis other elements in this model. Facts, then, are defined logically. The structure is connected with the constituent elements logically. The picture theory of meaning should work as a measure for approaching reality and its meaning. All propositions or words are supposed to be arranged according to the logical syntax. The pictorial relation is rooted in that, too. Wittgenstein described the world or reality *as pictured through* the logical form or logical syntax.

The reader might ask, what can be said by a proposition defined as a pictorial relation? A proposition is a logical picture of a situation. Here again the dominance of the logical syntax became evident because any proposition configures its place in logical space. Also, a coded language is a picture. In contrast to the coded language, a word or sentence configures its place in the way of acting as a 'form of life'. At the end of the 1920s Wittgenstein changed his view radically – as Russell did – and stated that a private language does not imply that only one person uses this language alone but, rather, that such a person does not know if some other person means the same thing by using the same or other words. Whereas Wittgenstein in the *Tractatus* adhered to the view that meaning is rooted in the mental state, that is, the intention of a speaker, he abandoned this view in the late 1920s. The common saying that

thoughts, mental states, or intention are transmitted into a language is due to the traditional view of language as being a veil of thoughts or inner states (Trabant 1995). Articulation cannot to be separated from thoughts because the articulation is the thought itself.

Wittgenstein here made the turning point towards the meaning and understanding of sentences as rooted in their use and context. The use of language in practices does not imply the transformation of a private language into a public language, as Wittgenstein (1967b) said of this misleading view precisely: 'Here is a chair. Can you see it clearly? – Good – Now translate it into French!'

Like Russell, Wittgenstein had also undertaken fundamental theoretical upheavals at the end of the 1920s. He gave up the view that the structure of language mirrors the structure of logic. He developed his view on language as a process of language activity. Language is a pattern of acting and a way of proceeding. It is inherently connected with speaking or language in action. Language is rooted in the context and contingency, not in the causality of mechanical reactions or logical systems. A certain feature of language is that there are unlimited sentences to be created in various language-games. The network of sentences or concepts constitutes the system of the world as experienced. Although the network is changeable, nevertheless it includes entrenched sentences which are not in themselves suddenly changeable. Up to now I have referred to language approaches which describe language in its role as a means of acting. To be sure, there exist other views which are not discussed in detail here. However, to be brief about that – just to cast light on the key difference – the cognitive semantic approach defined language as an inner or mental system of categories not linked to the communicative interactions. The cognitive system itself is conceptualized as separated from human interactions because it is modelled as a mental isle which reacts to signals received. Every person is endowed with such a system. Language is seen as an amount of a parameter which can be measured and guided by a signal.[6]

The next section outlines the views of Wittgenstein. He pointed out that when we act we are acting *within a* game. There is no difference to be made between acting in a game and the use of language.

5.3 Meaning and understanding

> For such judgment, policymakers have needed to reach beyond models to broader, thought less mathematically precise, hypothesis about how the world works. (Greenspan 2004, 38)

This chapter outlines the concept of 'language-game', which seems to be appropriate to central banking communication. I will provide consideration as to why central banking should base communicative interaction on the everyday language rather than on a coded language to mitigate uncertainty in the markets. In contrast to a coded language, which has been introduced in the previous chapter as an artificial language, everyday language implies interactions in real-time reference and, hence, provides a degree of certainty to the evolvement of participation, understanding, and agreement.

The notion language-game is a concept coherently connected with working or employing language. It does not mean a 'language-play'. In using language, we do not reflect on it, we do not contemplate it, but we are simply involved as an agent in the language-game or communicative interacting. There are different language-games and a multiplicity of new types of language-games while others have become obsolete and forgotten. There exist resemblances between different language-games as interconnected nets. Not only *'times are changing' but also language-games are changing and bringing, therefore, a change in concepts and in the meaning of words.*

Wittgenstein emphasized in *Philosophical Investigation* that the language-game is the 'primary thing' which gives meaning to the sentence (1978 § 656). The 'primary thing' incorporates habits and contexts and is understandable as a pattern of language-based interaction. In (1978 § 23) Wittgenstein described the concept language-game as follows:

> Here the term language-game is meant to bring into prominence the fact that the *speaking* of language is part of an activity, or a form of life. Review the multiplicity of language-games in the following examples, and in others:
>
> Giving orders, and obeying them –
> Describing the appearance of an object, or giving its measurements –
> Constructing an object from a description (a drawing) –
> Reporting an event –
> Speculating about an event –
> Forming and testing a hypothesis –
> Presenting the results of an experiment in tables and diagrams –
> Making up a story; and reading it –
> Play-acting –
> Singing catches –

> Guessing riddles –
> Making a joke; telling it –
> Solving a problem in practical arithmetic –
> Translating from one language into another –
> Asking, thanking, cursing, greeting, praying.
> – It is interesting to compare the multiplicity of the tools in language and of the ways they are used, the multiplicity of kinds of word and sentence, with what logicians have said about the structure of language (Including the author of the *Tractatus Logico-Philosophicus*).

Wittgenstein's approach to the language-game was first discussed in lectures he gave in Cambridge, in the years 1930–32 and 1933–34, which were initially published in the 'Blue Book' and 'Brown Book', and finally published posthumously in 1953 as a single volume, titled *Philosophical Investigations*. Wittgenstein developed considerations opposed to his early view of the *Tractatus* he was once devoted to – as the last sentence in the above citation indicates.

Language-games as introduced in *PI* constitute themselves as rules and conventions, as pattern of acting in the times of their occurrence. Language-games do not follow external rules or conventions. A language-game is seen as a paradigm (*PI* § 51). 'When language-games change, then there is a change in concepts, and with the concepts the meaning of the words change' (*On Certainty*, § 65), hence the paradigm changes, too. Regarding the uncertainty surrounding the language-acting, we cannot predict how a language-game will change, but we know how it has been changed up to the present. The decision to participate and the decision building process are anchored in patterns of habits, in the inherent background of the communicative interaction, and not in artificiality. Agents learn by practicing and participating (Bernanke 2004; Ehrmann and Fratzscher 2009; Kohn 2009).

As patterns of acting, the language-games are not invariable throughout time. This is also true for the language-games of the Federal Reserve Bank (Bernanke 2009). A pattern of acting and a way of articulating, it is impregnated by the changes of the context and environment (Blinder 2006; Blinder and Krueger 2004). It is important to emphasize that a central bank's pattern of acting structures the particular reality, that is, the environment and, hence, the relations of market interactions. This is of remarkable evidence for its task in guiding market expectations. A central bank's way of acting creates the normative meaning of sentences. The 'language analogy' as proposed by Winkler to replace the mechanical analogy of central banking rests on the following

considerations: 'Language is an instrument. Its concepts are instruments' (Wittgenstein 1978 § 569). Wittgenstein agrees with Kant and Humboldt in emphasizing that only 'concepts lead us to make investigations' (ibid § 570). Concepts are embedded in the language-game as different studies on central banking in different countries have shown (see also Ehrmann and Sondermann 2009). The speaking activity of central banks and the interactions with the market create particular realities. It configures a normative context and environment. The meaning of language activity is the result of the continuity of procedures of the meaning. Market agents are not empty boxes in which the central bank is going to fill in the meaning by a certain policy of disclosure.

The new paradigm of central banks refers to modern language science indirectly. According to this interdisciplinary research, both 'matching deeds to words' (Blinder) and 'we do what we say and we say what we do' (Issing) implies no divergence between saying and doing, that is, *words* in t_1 are also *deeds* in t_1. Issing argues through this sentence that 'words' are also 'deeds' (Wittgenstein). Both sentences do not contain a commitment from t_1 towards t_{1+1}. The meaning of a sentence refers to the practice of the use of language (Wittgenstein 1978 § 43). The meaning of a sentence cannot be separated from its use in situations, context, or the way of acting, as Wittgenstein stated (1978 § 120):

> When we talk about language (words, sentences, etc.) I must speak the language of every-day. ... You say: the point isn't the word, but its meaning, and you think of the meaning as a thing of the same kind as the word, though also different from the word. Here the word, there the meaning. The money, and the cow that you can buy with it. (But contrast: money, and its use)

The meaning of a sentence cannot be conceived by a method of decomposition into its parts. As stated, concepts, sentences, and words are embedded in *changing contexts and environments*. These changes are linked to different 'forms of life' including institutions, like a monetary institution (central bank). According to the empirical finding that central banks act to reach their mandate and react to particular information in a similar way, Winkler has also outlined two consequences of the proposed 'language analogy':

1) A language in order to create 'an own specific language and corporate culture to serve their particular internal and external coordination

needs' is not desirable. It is important that sender and receiver share the 'same language' (Winkler 2000, 23–24).

2) Once a language has been trained there are benefits of language in terms of a public good insofar as words and sentences have been used in a consistent and coherent way according to changing circumstances. Winkler also stated that a central bank's information and messages needed to be anchored in a public space of judgment which also requires translating it into a language which is also known by the audience.

Winkler emphasized common understanding as elementary for the success of central banking in order to earn the coordinative benefits resulting from the efforts of aiming at a correspondence of internal and external communication:

> It is clear that there are considerable switching and learning costs involved in adapting a new language. This provides a strong case for continuity and careful, evolutionary step when modifications in the strategy become necessary unless a 'new language' is needed to signal a clear break with the past. (ibid)

Winkler referred to the habits and methods of institutions which tend to develop their own language as 'linguistic codes' (Kreps 1990). However, this language also has to be learned. I would like to add an additional consideration:

3) Given its task of steering market expectations in order to reach its mandate of price stability, a central bank has to reflect upon its own communicative interaction based on everyday language, hence as a 'language-game', in order to mitigate uncertainty in the markets and to stabilize expectation-building through a greater common understanding.

Admittedly, there are many words used daily in economic interactions and economic science which seem to possess a stable meaning, for example, economic growth, unemployment or unemployment rate, exchange rate, real interest rates, nominal and real wages, and deflator. As ongoing debates have shown, many other economic concepts, for example, price stability, sustainable growth, and exchange rate movements based on macroeconomic fundamentals, are periodically changeable and changing concepts.

As is documented by reference to selective FOMC transcripts of the Volcker era, the concepts of price stability and price movements and the concept of inflation was impregnated by two main paradigms: the monetarist view and the so-called Keynesian view. Greenspan similarly objected to implementing a numerically specified target for the Federal Reserve in order to define price stability. Blanchard, Dell' Aricca and Mauro (2010), International Monetary Fund (IMF), recently proposed to aim at an agreement between policy-makers and economists and, hence, central bankers, that price stability should be defined by 4 percent instead of the current accepted limit of 2 percent. 'Is it more difficult to anchor expectations at 4 percent than at 2 percent?' ('Should the Inflation Target be Raised?' ibid, 2010, 11). This proposal was immediately and negatively responded to by members of the European Central Bank, for instance Trichet and Bini Smaghi, among others.

> Identifying the flaws of existing policy is (relatively) easy. Defining a new macroeconomic policy framework is much harder. The bad news is that the crisis has made clear that macroeconomic policy must have many targets; the good news is that it has also reminded us that we have in fact many instruments, from 'exotic' monetary policy to fiscal instrument, to regulatory instruments. (Blanchard 2010, 10)

Many other concepts – for example, the Federal Reserve funds rate or discount rate of the Fed interest rates of money markets or bond markets, prices of option markets and prices of different good markets – work as scientific key terms. What they have in common is the fact that they do not refer to entities ontologically. Since experience can only be grasped and made through concepts, I propose that economics reflect this in its procedure of creating the meaning of concepts. Like other social sciences, economics is confronted with the relativity of the meaning of its concepts, or with the problems of context-sensitivity of the meaning and the need to focus on the understanding. Economic reality also emerges out of communicative interacting – as the current financial crisis has shown with clarity. The language-game represents the meaning of words and terms in relation to the conditions of life in society, lifestyle (Tugendhat; Wittgenstein), or lifeworld (Habermas).

Economic reality is partly constructed by particular concepts and terms (Knobloch 1999; Trabant 2009). However, the real economic facts and data deliver real economic real substances, for example, the balance of payment imbalances or international monetary relations,

currency union, and exchange rate targeting. Of course, a language-based constructed economic reality is not the whole story, if we look, for instance, at poverty, wealth, and external effects. The history of how the term 'external effects' has gained ground as a concept among economic scientists has shown, for instance, that conceptual changes and the procedures of creating new or distinct concepts and, hence, their acceptability in the community of science, occur throughout a long-lasting period of time.

Many of the above-mentioned concepts seem to work like codes because they seem to be exact, precise, and unambiguously defined words. Every agent in the market understands immediately what is meant by these concepts. Moreover, these concepts seem to possess an ontological reality because of their supposed incorporated reality and objectivity. They are understood as representatives of real economic entities which imbue information and strategies with clarity and confidence. These concepts also seem to function as an anchor for expectation-building. They are understood as real facts and as cognitive currency in the economic interactions, where they achieve their meaning in the contexts. To my view, economics as modern and self-reflecting science should not adhere to ancient principles or metaphors. Economics will not achieve acceptance and credibility by stating that economics is simply a mechanical exercise analogous to the pendulum proposed by Isaac Newton who – as Keynes (*Essays in Biography* 1942) investigated in his article 'Newton, the Man' – was himself a construct of his time:

> In the eighteenth century and since, Newton became to be thought of as the first and greatest of the modern age of scientists, a rationalist, one who taught us to think on the lines of cold and untinctured reason. I do not see him in this light. I do not think that any one who has pored over the contents of that box which he packed up when he finally left Cambridge in 1696 and which, though partly dispersed, have come down to us, can see him like that. Newton was not the first of the age of reason. He was the last of the magicians, the last of the Babylonians and Sumerians, the last great mind which looked out on the visible and intellectual world with the same eyes as those who began to build our intellectual inheritance rather less than 10.000 years ago. Isaac Newton, a posthumous child born with no father on Christmas Day, 1642, was the last wonder-child to whom the magi could do sincere and appropriate homage.

Indeed, the modern view of central banking has already started to reflect its own language-based interactions. However, economic science should more actively acknowledge the importance of language regarding the creation of economic 'facts and fictions'. One important step in this direction is to expand economic methods towards instruments that go beyond deductive reasoning. A variety of inductive methods is needed in order to obtain more clarity on language-based economics. The 'language analogy' (Winkler) should be applied to many more branches of economics. Language is a method to acknowledge, and the main instrument to create and shape the world. The language-based approach to economic issues implies that these procedures should also be part of economic science and not delegated or 'outsourced' to linguistic sciences. Economic reality is based on language construction and it is not possible to eliminate the vagueness and ambiguity of meaning by substituting it with logical constructions. The everyday language-based economy cannot be substituted by logic or deductive principles.

There exists no ideal language – not even logic or mathematics – with which to build up an economic science as an exact, non-ambiguous, and precise reality (see the argument by Russell, Ramsey, and the early Wittgenstein). An artificial language would fail since language evolves from its use in practice (Davidson 1994, 11):

> What is needed is a norm, something that provides a speaker with a way of telling (not necessarily always) that he has gone wrong, a norm the failure to satisfy which he or she will count as having gone wrong. ... Speaking in accord with socially accepted usage is such a norm, but one which, I have argued, is irrelevant to communication unless the audience of the speaker happens to speak as he does, in which case the norm is irrelevant not because it is a shared practice or convention, but because conforming to it results in understanding.

Why does such a norm matter? It provides a purpose for any speaker who wishes to be understood. Successful communication results in shared practices. The obligation, therefore, is to use words, that is, sentences, in such a way as to accomplish the purpose by being understood the way we expect. Therefore, a central bank will earn credibility by 'matching deeds to words', not by creating an artificial language that is not rooted in central bank practice itself.

> Meaning, in the special sense in which we are interested when we talk of what an utterance literally means, gets its life from those

> situations in which someone intends (or assumes or expects) that his words will be understood in a certain way, and they are. ... Thus, for me the concept of 'the meaning' of a word or sentence gives way to the concepts of how a speaker intends his words to be understood, and of how a hearer understands them. Where understanding matches intent we can, if we please, speak of 'the meaning'; but it is understanding that gives life to meaning, not the other way around. (Davidson 1994, 11)

As argued at the beginning of this chapter, a central bank's talk and language and, hence, its communication should rely on every day language. Wittgenstein gave reasons (1979 § 204) why coded language does not matter:

> Giving grounds, however justifying the evidence, comes to an end; – but the end is not certain propositions' striking us immediately as true, i.e. it is not the kind of *seeing* on our part; it is our *acting*, which lies at the bottom of language game.

Uncertainty would be enhanced by a coded language of central banking for reasons as outlined. However, in the connection of words and deeds, hence the *Thaetigkeit*, the communicative interacting as embedded in daily life and everyday language, provide certainty as a mode of agreement at hand (in the situation or language-game). Language-games constitute objects, truth, and convention insofar as agents do have confidence in the game. This is a prerequisite to participating in it. The pattern of language-based acting has been written by letters of life.

As Winkler proposed, the language analogy of the modern view of central banks should also pay attention to common understanding. What can be said about this understanding? Since the use of a concept is embedded in practice and interactions of agents and institutions, and in their expectations, goals, and the desire to be understood, the meaning and the understanding of a word or sentence depends on that contextual framework. Vagueness is characteristic of language, which is a social phenomenon. Trying to express a central bank's or central banker's statement in formal language would preclude common understanding.

Using a language is part of an activity or speech act which aims for common understanding. The meaning, implication, or interpretation still has to emerge from the interactive process involving all the

participants in the communication. The language of the actors is primarily addressed neither to names or signs, nor to things or objects. Rather, it leads to a coherence of meaning and understanding in the communicative interactions in that field, framework, or context.

Understanding is a result, and as such a capability to participate in market procedures. Since every participant plays a certain role by acting in different language-games, the use of everyday language is a way of acting. Understanding is not a mechanism which can be determined or defined by deductive reasoning or by purely mechanical elements. Understanding is not the deciphering of codes or input-output transformation. It is not deductive reasoning, like a coded language. If one says the code employed in a language corresponds to a particular sense or meaning, this does not in itself lead to a meaning and understanding but, rather, just to substitution.

Although meaning and understanding are not encapsulated in a concept, this does not imply that the text producer (for example, the central bank) offers an empty piece of paper which should be filled in by the audience's sense-giving in different contexts. We can argue that the central bank as a text producer tries to steer not only the expectations but also the attention of the audience. According to the history of language science, the subjective approach to language and understanding, wherein the listener discovers the meaning of the sent message, substituted the 'conduit metaphor' (see Chapter 1). However, a subjective approach has not been judged as an acceptable alternative. Understanding is rooted neither in mental states nor in the subjective construct of the meaning.

So where to go? If we remember that language is an activity, hence a language-game, we are able to argue that language – which is not private property – works as a public good and as an inter-subjective instrument. Understanding, which is based on the language as used in a dynamic way, echoes past events. It is the speaker, his experience of communication, his uses of the language, and the reaction from a multiplicity of listeners which echoes the understanding.

Understanding a text is interpretation, or text-based language activity. The text neither 'speaks' on its own nor is it an empty piece of paper. A text does not have a static meaning except where we attach such a static meaning to the text, such as is the case regarding instructions on how to use a machine. To understand (a text) is judging inferentially. To understand leads to further language-based activity. To understand implies participating in language-based interaction and, hence, to advance a step further. Inference from a language event or language-based event is

always embedded in knowledge and experience. Therefore, understanding is part of a language-based activity and, hence, reflexive. According to Analytical Philosophy and the modern view of language science, understanding is agreement in practice:

> [R]egularity, on agreement in action. ... We say that, in order to communicate, people must agree with one another about the meaning of the words. But the criterion for this agreement is not just agreement with reference to definitions, e.g. ostensive definitions – but also an agreement in judgments. It is essential for communication that we agree in a large number of judgments. (Wittgenstein 1983, 342–43)

As explained in current debates in central banking and also the proposal by the IMF according to a new inflation targets, different cultures generate different ways of understanding and conceptualizing transparency and communication. Empirical findings on central bank transparency and information policy strategy document that the language a central bank has chosen to express or explain its monetary strategy may differ considerably across countries and central banks. Regardless of how the mandate of a central bank is precisely established in different countries, the imperative in implementing a successful monetary policy of achieving price stability has been accepted as an 'iron law' of central banking in the economy.

6
Conclusion

Following recent scientific research, I have attempted to achieve four considerations concerning the implications and consequences of the new paradigm of central banking. I have drawn a clear distinction between a central bank's communicative interaction, hence the meaning of communication which is the key issue, and the implementation of a particular monetary policy, which is secondary.

First, I have shown that the term 'monetary mystique' (Brunner) differs from the general idea of 'mystique'. With respect to the iron law of communication theory – *'it is not possible to avoid communication'* – already accepted in social sciences and humanities, I have argued that meaning and understanding *do not arise beyond interaction* with agents of the financial markets and the central bank. Meaning and understanding are embedded in the context and environment. Therefore 'monetary mystique' described the lack of understanding and meaning. Something seems to have a 'mystique' when we do not have a full understanding of it.

I have then explained why the concepts 'matching deeds to words' (Blinder) and 'we do what we say' and 'say what we do' (Issing) are not encapsulated in a logical semantic or in deductive reasoning, but in a way of communicating action. The use of everyday language has its reference in concepts which refer to the means of acting and not to a coded language. Transparency and accountability refer to the central bank's *practice*, not to abstract premises. Achieving transparency and credibility can only be defined as a degree of transparency, or degree of credibility, because both concepts refer to the means of acting.

Secondly, I have tried to elaborate further reasons supporting why the 'language analogy' (Winkler) should replace the 'car analogy' in central bank literature. I have emphasized several aspects which describe the

changing environment of the central bank. As meaning and understanding cannot be separated from context, a coded language or formal language approach to central banking would in fact increase the uncertainty which surrounds the central bank's action. Transparency and accountability are the result of verbal and non-verbal interactions and of reciprocal relationships between a central bank and the market regarding changes in market variables and the perceived reaction by the central bank and the markets.

Thirdly, I have argued in favour of an interdisciplinary approach to central bank communication, following the proposal by Akerlof (2007). Such an interdisciplinary concept of communicative interaction is linked to the modern concepts of meaning and understanding in modern cognitive sciences and language sciences. Due to the 'language analogy' a central bank signals its verbal and non-verbal participation within a social context and reflects the reciprocal relationship with the market, which has to be perceived, interpreted, and understood.

Finally, I have proposed a conceptual framework of communicative interaction based on three dimensions, in which information is conceptualized *as a related object*. This raises the question of how the released information will be perceived and acknowledged. I have introduced an interdisciplinary perspective on how the acknowledgment, meaning, and understanding can emerge. To understand language and communicative interactions does not require reliance on a universal theory of understanding or a coded language. Any debate about a formal language approach to economics should be addressed to at least two main concerns (Morishima 1991): (a) the ontological aspect and (b) the epistemological aspect of economic reasoning. The ontological aspect concerns the focus of mathematical propositions. Do mathematical propositions say something about the mathematic system itself or about the empirical world? This question brings us to (b): The epistemological aspect deals with the question of whether we acquire and enlarge mathematical knowledge, or knowledge related to the empirical world, by the use of mathematics. Modern science abandoned the justification of causal principles by introducing conceptual investigations. The conceptual investigation was refined by Humboldt and Wittgenstein by explicating the context-sensitivity of concepts and, hence, the importance of context and circumstances regarding conceptual investigations.

Dramatis Personae

1. Blinder, Alan (1998) *Central Banking in Theory and Practice*. Cambridge, MA: 64.
2. Issing, Otmar (1999) 'The Eurosystem: Transparent and Accountable or "Willem in Euroland"'. In: *Journal of Common Market Studies*, Vol. 37, No. 3: 503-19: 508.
3. Wittgenstein, Ludwig (1978) *Philosophical Investigation*. Basil Blackwell, Oxford: § 546.

Introduction

1. I gave an appraisal of this issue: Muchlinski (2005, pp. 130–47).

1 The Way Out of 'Monetary Mystique'

1. http://www.federalreserve.gov/monetarypolicy/files/FOMC19800109meeting.pdf date of access 12.12.2009, p. 14.
2. Bailey and Schonhardt-Bailey (2005) evaluated the FOMC Transcripts of the year 1979 in order to provide textual evidence for a change of the attitudes of FOMC members towards anti-inflationary decision-making.
3. Aspects concerning foreign market and the exchange rates of the U.S. dollar were on the agenda of the meetings in the years 1979 to 1983.
4. The new wording was published in the 'Bluebook' 02/1979, pp. 19–21.
5. Chuck Partee at the conference call June 23, 1980 (ibid, p. 2): 'My only question is whether we ought to move further. I would agree with the Chairman, though, that we would want to be gradualist about this and that we have a meeting coming up not too long from now, so $400 to $500 million is acceptable to me'.
6. Furthermore 'secrecy' is, it is argued, also required in the case of a central bank's intervention in a foreign market (Chiu 2003; Fratzscher 2004, 2006). Fratzscher (2008, 149) offered new empirical findings on how exchange rates incorporate new information regarding three main channels. (1) The portfolio balance channel refers to foreign exchange interventions by central banks. (2) The signalling channel documents that long-term interest rates, stock prices, and exchange rates are significantly driven by expectations and, hence, communication and oral-intervention. The coordination channel draws attention to the 'double edged' (Amato, Shin, and Hyun 2003) of language as a function to convey information and provide an anchor for expectations-building. I turn to the so called 'double edged' function of language in chapters 5 and 6.
7. See Keynes (1936) *General Theory of Employment, Interest and Money* (1936), chapter 5.
8. Ehrmann and Sondermann (2009) provided a new empirical study according to the hypothesis that public signals minimize the volatility insofar as agents' beliefs are based on private information. The disclosure of the main

publication of the BoE (inflation report macroeconomic information) seem to be judged as 'stale over time' and hence private information has become more relevant for market driven variables (2009, 21).

9. See also chapter 2.3.2: Habermas' approach to communication and validity claims as composed of three types of validity: 'truth', 'rightness', and 'sincerity'.
10. Winkler does not adopt a 'socio-linguistic approach' as Geraats (2002) stated. For a 'socio-linguistic approach' read Coulmas (2005). Geraats revised her interpretation: see Geraats (2006).

2 A Conceptual Framework for Central Bank Communication

1. A comprehensive introduction on model of communication is provided by Strohner (2001), Rickheit, and Strohner (2008).
2. Due to this antique view the aspect of semantic was seen as unimportant, see Shannon, and Weaver (1963/1949), see also Reddy (1979) in: Ortony (ed.) (1979, 284–324).
3. In another paper, Lakoff and Johnson (1980a) contributed to the debate 'the essence of metaphor is understanding and experiencing one kind of thing in terms of another'.
4. Heuristic methods were also introduced by Kahneman and Tversky (1996), and in Tversky and Kahneman (1981) to emphasize a nonlinear and recursive process of information processing. Following the death of Tversky, Kahneman has recently enlarged the scope of the research (Kahneman and Tversky 2002); see also Brandstätter, E., Gigerenzer, G., and Hertwig, R. (2006), Gigerenzer and Brighton (2009), Gigerenzer, Hertwig and Pachur (2011).
5. Giddens, A. (1989) For further investigation on Giddens and the structuration theory as 'an attempt to work out an overall ontology of social life, offering concepts that will grasp both the rich texture of human action and the divers properties of social institutions', see Windeler (2001, 146).
6. The concept of 'indeterminacy' goes back to Quine (1959).
7. The 'Speech act theory' was founded by Austin (1962) and Searle (1969). Searle and Austin developed further the theory of speech act by integrating the language view provided by Ludwig Wittgenstein.
8. The problems of the 'speech act theory' should not be evaluated here because much work has already been done on this. See for instance, Fermandois (2000), who investigated the roots, implications, and consequences of the speech act theory in detail.
9. Early theories emphasize that communication is rooted in the sender's receptive efforts to construct an understanding (Altmann and Koch 1998). For instance, the founder of the 'radial constructivist approach', Maturana, failed to explain understanding as cognitive processing of information. He maintained the mechanical point of view of transmitting information. Also, Luhmann, who was influenced by that early constructivist approach, failed in this regard. He defined social agents, people, and institutions as 'referential systems'. Focusing on system as an autonomous entity, he eliminated the distinction between social actions, communication, knowledge,

and judgment. Any system in itself is defined as autonomous and referentially oriented as 'autopoesis' (Luhmann 1984).

10. The modified theories of information transmission today go beyond the formula Lasswell introduced in the 1940s.
11. Wittgenstein debated with Waisman, a member of the Vienna Circle, about this issue: see Wittgenstein (1967a). Wittgenstein proposed not to reconstruct intention as a mental state since the understanding of symbols, words or sentences occurs by the articulation in practice, that is, the use of language (Muchlinski 2006). Language is not neutral towards thoughts.
12. Stekeler-Weithofer (1999) proposed six criteria for communication: clarity, truth, explicitness, relevance, realism, and charity.
13. See also Künne (1990, 212–36).
14. Heath (2001, 23) proposed reading Habermas in the light of game theory approach. Heath differentiated between 'strategic action' and 'communicative action'. Whereas strategic actions refer to game theory – for instance, common knowledge, rational action alternatives and an acquainted probability distribution – communicative actions refer to a public realm created by language activity in order to solve coordinative problems.
15. Stekeler-Weithofer (2004, 180) concluded Davidson failed to develop his theory towards a theory of communication.
16. See chapter 2.3. On further introduction to miscommunication, see: Parret (1994), Taylor (1992).

3 Central Banking and Communication As a Function of Circumstance

1. Cukierman (2002, 15–35) gives an introduction to three main types of central bank transmission models, which are based on three different types of expectations hypotheses – the expectations-augmented Phillips curve (model 1), the fully backward-looking pricing model (2) and (3) a New Keynesian Transmission Mechanism with Forward-Looking Pricing model. The core premise of model, for example, is that changes in the expectations of future variables, prices or interest rates fundamentally affect current pricing behaviour. Cukierman also stated that two elements of the central bank's context and environment remain opaque: the Federal Reserve Bank's model and objectives. This is also the case of other central banks in industrialized countries because central banks are not willing to disclose 'their' model to the public.
2. Further analyses and contributions to this issue are also to be found in the conference 'Getting the Markets In Synch with Monetary Policy', Proceedings of the Twenty-Sixth Annual Economic Policy Conference of the Federal Reserve Bank of St. Louis, in *Federal Reserve Bank of St. Louis, Review*, July/August 2002, Vol. 84, No 4.
3. The Taylor Rule has been extensively discussed in Orphanides and Williamson (2005) among many other contributions.
4. Bernanke (2004a) referred to the biographer of Montagu Norman, a former governor of the Bank of England.

5. To give a complete list of the contributions here would take up a great deal of space; see, for example, Blinder (2009), Ehrmann and Sondermann (2009).
6. Among the literature on this topic, see, Ehrmann and Fratzscher (2009, 2007a, 2007b, 2005a, 2005b, 2003), Fracasso et al. (2003), Heinemann and Ulrich (2005), Schmidt and Ullrich (2006), Berger, de Haan, and Sturm (2006).
7. The *International Herald Tribun*e reported: 'the Growing Greenspan Role Worries Some' (Friday, October 2001). 'Greenspan has been everywhere in guiding economic policy in the wake of the terrorist attacks – slashing interest rates, helping to get Wall Street running again, shaping the tax cuts being developed by the Congress and evaluating which airlines should receive government loan guarantees.' Politics became wary of the greater influence of the monetary policy in their own terrain, whereas some economists feared that the Federal Reserve would be too involved in politics and hence lose its independence.

4 Economics and Language

1. I should repeat here that I do not turn to contributions of the game theory and experimental research on game theory and public good experiments. See: Brosig, Jeannette/Weimann, Joachim/Ockenfels, Axel (2003).
2. I do not prefer the traditional view of economics as proposed by Friedman (1953), who followed Popper (1934). For an overview and criticism of this traditional view, see Dunn and Maddala (1996), Kuhn (1962), and Mirowski (1988).
3. For an approach on modern institutions, see McCloskey (1994).
4. FRB means the Federal Reserve Board: the FRB/US model focused on the U.S. Economy and the FRB/Global on the United States and the Rest of the World Economy (R.O.W.).
5. 'VAR expectations are identical to the forecasts of a small vector autoregression (VAR) model that includes equations for a few key economic measures. This is another option for expectations formed used in FRB/US', Brayton et al. (1997a: 228).
6. Russell (1905, 1914) provided different examples in order to discuss the problem with truth condition; see also Künne (1990, 1993); see also Dascal (1994, 323–34).
7. For conceptual investigation on the historical lines of modern view of language, see Trabant (2003).
8. 'It is, a priori, clear that in analysing we must arrive at simple components – is this, e.g. involved in the concept of analysis –, or is analysis ad infinitum possible? – Or is there in the end even a third possibility? ... And it keeps on forcing itself upon us that there is some simple indivisible, an element of being, in brief a thing', Wittgenstein (1979) *Notebooks 1914–1916*.
9. The controversy in the literature about that issue should not be repeated here. See Scholz (2001), Stekeler-Weithofer (1999), Lakoff (1977, 79–106).
10. This view has been enlarged to a research area, for instance see Beton.
11. Scholz (2001^2: 111, 196, 204ff.), ibid.

12. Wilhelm Quine (1908–2000), an American logician and philosopher, who taught at Harvard. He was influenced by Bertrand Russell (1872–1970) a British logician and philosopher.
13. Lewis referred to Schelling (1960).
14. Research on that field of cognitive sciences, economics, and rationality is provided by Gigerenzer (2004a).

5 Language, Expectations, and Circumstances

1. See Trabant (1998, 1999, 2003, 2009).
2. The term Analytical Philosophy encompasses both the roots of Analytical Philosophy (see Dummett 1993; Nagel 1974) and the current state of Analytical Philosophy which could be categorized by different branches, for instance, the rejection of metaphysics (Frege, Moore, Ramsey, Russell, and the early Wittgenstein), the Vienna Circle and Positivism (Carnap, Hahn, Neurath) and the Language Philosophy or 'linguistic turn' (Austin, Brandom, Ryle, Searle, Tugendhat, the late Wittgenstein).
3. 'So wenig wie eine poetische Form, etwa Rhythmus und Reim, die Glaubwürdigkeit der mit ihrer Hilfe erlernbaren Merksätze erhöht, so wenig definieren Axiome und Deduktionsregeln die Wahrheit der deduzierbaren Sätze' (Stekeler-Weithofer 1999, 512).
4. The 'early Wittgenstein' concerns the *Tractatus Logico-Philosophicus* – quoted as *Tractatus* – he published in 1918. Shortly after publication he had started to criticize his *Tractatus*. Also Russell, Ramsey, and Keynes addressed their criticisms to that view on language (see Muchlinski 2011).
5. In contrast to Russell and Wittgenstein, Carnap (1928) tried to improve his view that language and reality are driven by logical syntax.
6. Criticisms addressed to this view are given by Trabant (1998).

ACKNOWLEDGMENTS

THIS BOOK COULD NOT HAVE BEEN WRITTEN without the help of a great many people around the world. First I must thank John Christensen, who has worked tirelessly with me on this book, and who deserves much of the credit. (Any mistakes, though, are mine.) Alongside him stand several leaders in this field, each of whom has provided remarkable help and insights, and each of whom has contributed in a range of ways. This group, in alphabetical order, includes Jack Blum, Ray Baker, Richard Murphy, Ronen Palan, Sol Picciotto and David Spencer. Special mention must also go to Paul Sagar and Ken Silverstein for their terrific contributions on the history of the British spiderweb and on Delaware, respectively.

A number of others deserve great thanks too, for their time and their help in specific areas. They are Jason Beattie, Rich Benson, Richard Brooks, Michèle, Elliot and Nicolas Christensen, Andrew Dittmer, Sven Giegold, Maurice Glasman, Bruno Gurtner, Mark Hampton, Jim Henry, Dev Kar, Pat Lucas and her merry team, Mike McIntyre and his brother Bob, Andreas Missbach, Matti Kohonen, Markus Meinzer, Prem Sikka, Father William Taylor, and Geoff Tily.

I couldn't have got this far without Karolina Sutton at Curtis Brown, and I would also like to give special thanks to the staff at Palgrave Macmillan, at Random House, and to Dan Hind. Second last, but by no means least, a particular thank you to the Joseph Rowntree Charitable Trust, and the Tax Justice Network, which made all this possible. And finally, I would like to offer my thanks, appreciation and respect to all those in the tax havens who have spoken out against the consensus, sometimes at great personal risk.

PROLOGUE
An Offshore Awakening

ONE NIGHT IN SEPTEMBER 1997 I RETURNED home to my flat in North London to find that a man with a French accent had left a message on my answering machine. Mr. Autogue, as he called himself, had heard from an editor at the Financial Times (whom I was writing for) that I was to visit the oil-rich country of Gabon on Africa's western coastline, and he said he wanted to help me during my visit. He left a number in Paris. Curious as hell, I rang back the next morning.

This was supposed to be a routine journalist's trip to a small African country: I wasn't expecting to find too much to write about in this sparsely populated former French colony, but the fact that English-speaking journalists almost never ventured there meant I would have the place all to myself. When I arrived, I discovered to my surprise and alarm that Mr. Autogue had flown out to the capital of Libreville with an assistant on first-class Air France tickets and they had booked themselves into the city's most expensive hotel for a week—and their sole project, he cheerfully admitted, was to help me.

I had spent years watching, living in, and writing about the curve of oil-soaked African Atlantic coastline that ranges from Nigeria, in North Africa, through Gabon and down to Angola, farther south. Today this region supplies almost a sixth of U.S. oil imports[1] and about the same share of China's; and beneath a veneer of great wealth in each place lies terrible poverty, inequality, and conflict.

Journalists are supposed to start on the trail of a great story somewhere dramatic and dangerous. I found my story here unexpectedly, in a series of polite if unsettling meetings in Libreville. Lunch with the finance minister? No problem: Monsieur Autogue arranged it with a phone call. I drank a cocktail in a hotel lobby with the powerful half-Chinese foreign minister Jean Ping, who later became president of the U.N. General Assembly; the estimable Mr. Ping gave me as much of his time as I needed for my interview and asked graciously about my family. Later, the oil minister clasped me by the shoulder and jokingly offered me an oil field—then withdrew his hand, saying, "No: these things are only for les grands—the people who matter."

Never more than five hundred yards from foul African poverty on the streets of Libreville, I spent a week wandering about in a bubble. Mr. Autogue's attempts to keep my diary full made me determined to find out what it was that he might be wanting to hide. My new best friend had opened for me a zone of air-conditioned splendor: I was ushered to the front of queues to meet with powerful people, who were always delighted to see me. This parallel, charmed world, underpinned by the unspoken threat of force against anyone inside or outside the bubble who would disrupt it, is easy to miss in the affluent and easy West. In Africa the jolt was enough to begin to shake me from my sleep.

I had stumbled into what later became more widely known through a scandal in Paris as the so-called Elf affair.

The scandal began in 1994 when U.S.-based Fairchild Corp. opened a commercial dispute with a French industrialist, triggering a stock exchange inquiry. Unlike in more adversarial Anglo-Saxon legal systems, where the prosecution jousts with the defense to produce a resolution, the investigating magistrate in France is more like an impartial detective inserted between the two sides. He or she is supposed to investigate the matter until the end, when the truth is uncovered. In this case Eva Joly, the Norwegian-born investigating magistrate, found that every time she investigated something new leads would emerge. Her probes just kept going deeper. She began receiving death threats: A miniature coffin was sent to her in the post, and on a raid of one business she found a Smith & Wesson revolver, fully loaded and pointed at the entrance. But she persisted: Other magistrates became involved, and as the extraordinary revelations began to accumulate, they began to discern the outlines of a gigantic system of corruption that connected the French state-owned oil company Elf Aquitaine with the French political, commercial, and intelligence establishments, via Gabon's deeply corrupt ruler Omar Bongo.

Bongo's story is a miniature tale of what happened when France formally relinquished its colonies. As countries in Africa and elsewhere gained independence, the old beneficiaries of the French empire set up new ways to stay in control behind the scenes. Gabon became independent in 1960, just as it was starting to emerge as a promising new African oil frontier, and France paid it particular attention. France needed to install the right president: an authentic African leader who would be charismatic, strong, cunning, and, when it mattered, utterly pro-French. In Omar Bongo they found the perfect candidate: He was from a tiny minority ethnic group and had no natural domestic support base, so

he would have to rely on France to protect him. In 1967, aged just 32, Bongo became the world's youngest president, and for good measure France placed several hundred paratroopers in a barracks in Libreville, connected to one of his palaces by underground tunnels. This intimidating deterrent against coup plots proved so effective that by the time Bongo died in 2009, he was the world's longest-serving leader.

In exchange for France's backing Bongo gave two things. First, he gave French companies almost exclusive access to his country's minerals, on highly preferential terms that were deeply unfair to the people of Gabon. The country became known as French companies' chasse gardée—their private hunting ground. But the second thing Bongo provided was more interesting. He allowed his country, through its oil industry, to become the African linchpin of the gigantic, secret Elf system—a vast, spooky web of global corruption secretly connecting the oil industries of former French African colonies with mainstream politics in metropolitan France, via Switzerland, Luxembourg, and other tax havens. Parts of Gabon's oil industry, Joly discovered as she dug deeper and deeper in Paris, had been serving as a giant slush fund: a pot of secret money outside the reach of French judicial authorities in which hundreds of millions of dollars were made available for the use of French elites. An African oil cargo would be sold, and the proceeds would split up into a range of bewildering accounts in tax havens, where they could be used to supply bribes and baubles for whatever the unaccountable elites who controlled the system deemed fit.

Out of this pot, money flowed secretly to finance French political parties, the intelligence services, and other well-connected parts of French high society. Elf's secret money greased the wheels of French political and commercial diplomacy around the globe: France's biggest corporations were allowed to use this West African oil pot as a source of easy bribe money to support their bids for giant contracts ranging from Venezuela to Germany to Jersey to Taiwan—and the out-of-sight Gabon connection meant that the money trails did not lead to them. (One man told me how he once carried a suitcase of cash provided by Omar Bongo to pay off a top rebel separatist in the Angolan oil enclave of Cabinda, where Elf had a lucrative contract.)

President Bongo, for his part, was one of the smartest political operators of his generation and tapped into French Freemasonry networks and African secret societies to become one of the most important power brokers in France itself. He was the key to French leaders' ability to bind les grands—opinion-formers and politicians from

across Africa and beyond—into France's postcolonial foreign policy. This immensely powerful, corrupt subterranean system helped France punch above its weight in global economic and political affairs and remain significantly in control after independence, behind the scenes. A local

journalist summed the relationship up for me most effectively. “The French went out of the front door,” he said, “and came back in through a side window.”

The system emerged gradually, but by the 1970s it was already serving as a major secret financing mechanism for the main French right-wing party, the Rally for the Republic (RPR).[2] When a Socialist, François Mitterrand, became French president in 1981, he sought to break into this right-wing Franco-African offshore cash machine and installed his man Loïk le Floch-Prigent at the head of Elf to do the job. But the latter was wise enough not to cut out his rivals in the RPR. “Le Floch knew that if he cut the financing networks to the RPR and the secret services, it would be war,” explained the French authors Valerie Lecasble and Airy Routier in an authoritative book on the affair.[3] “It was explained that, instead, the leaders of the RPR—Jacques Chirac and Charles Pasqua—did not mind the Socialists taking part of the cake, if it were enlarged.” So the Elf system grew. It became more baroque, complex, and layered, and it began to branch out into international corruption so grand that Mitterrand’s man le Floch-Prigent was moved to describe France’s intelligence services, which dipped freely into the slush, as “a great brothel, where nobody knows any more who is doing what.”[4]

The system was a kind of open secret: A few well-connected French insiders knew all about it, and a fair number of educated outsiders in France knew something important was afoot but didn’t know the details and largely ignored it. Yet almost nobody could see the whole thing in overview. Everything was connected through tax havens. The paper trails, as the magistrates were discovering during my Libreville trip, were typically sliced among Gabon, Switzerland, Liechtenstein, Jersey, and beyond. Joly admitted that even though she probed deeply she only ever saw fragments of the whole picture. “Endless leads were lost in the shifting sands of the tax havens. The personal accounts of monarchs, elected presidents-for-life, and dictators were being protected from the curiosity of the magistrates.”[5]

My trip to Gabon in late 1997 came at an exquisitely sensitive time. On November 7 of that year, less than a week after I left Libreville, Christine Deviers-Joncour, a former lingerie model, was sent to jail in the southern suburbs of Paris, still protecting the secrets of her lover Roland Dumas, the French foreign minister. She was jailed for suspected fraud after magistrates found that Elf had paid her over $6 million to help “persuade”

Dumas, a haughty prince of the Paris political clans, to do certain things—notably to reverse his public opposition to the sale of Thomson missile boats to Taiwan. On an Elf credit card she had bought him gifts, including a pair of hand-made ankle boots from a Paris shop so exclusive that its owner offered to wash customers' shoes once a year in champagne. Nobody thanked her for her discretion, and five and a half months in jail gave her time to reflect on her treatment. "A flower, a single flower, even sent to me anonymously [in jail] would have been enough," she later explained.[6] "I would have known it came from Roland." The following year she cast aside the code of silence and published a book, The Whore of the Republic, which became a best seller in France.

So when I visited Gabon at that especially tricky moment, the Elf networks must have wondered why this English journalist was nosing around in Libreville. Was I really a journalist? No wonder Mr. Autogue took such an interest in me. Recently, I tried to find him, to ask him about our week together. His old phone numbers no longer work, several Africa experts in Paris hadn't heard of him, Internet searches turned up no trace of him or the company he claimed to represent, and the only person with that name in the French phone book has, a surprised-sounding wife in a rural Dordogne village informed me, never been to Gabon.

The Elf system, when I visited, was dying. The magistrates' investigations were in full swing, and they finally secured 31 convictions in November 2004 after eight years' work. Elf Aquitaine has since been privatized and is now part of the Total group, which has an utterly different character from the old Elf. Still, Elf was not the only creature in the corrupt Franco-African system—myriad smaller pots of offshore money existed too. And though Elf is long gone, it seems that the system is not really dead. When President Nicolas Sarkozy of France came to power in 2007 the first person he called was not the president of Germany or the United States or the European Commission but Omar Bongo. The French troops remain in place in Gabon today, connected by underground tunnels to the presidential palace. In January 2008 the French aid minister, Jean-Marie Bockel, complained that a "rupture" with a corrupt past that French leaders had promised "is taking its time to arrive." He was summarily sacked.[7] If the Elf system is dead, then French elites seem to have replaced it with something else.

Gabon is on no list of tax havens anywhere. But the Elf system that it hosted was part of, and a metaphor for, the offshore world. To understand this, it is necessary to explain some fundamental truths about what a tax haven or offshore jurisdiction is.

Tax havens provide escape routes from rules and laws elsewhere. These two words, "escape" and "elsewhere," will crop up repeatedly in this book. The zero tax rates offered in the Cayman Islands, for example, are not designed for Caymanians but are set up to attract the business of North and South Americans, Europeans, Asians, Middle Easterners, and Africans alike.

In truth, the term tax haven is a bit of a misnomer because these places offer an escape not just from taxes but from many other rules and regulations too. If a person or entity wants to do something but is forbidden by law from doing it at home, it escapes to somewhere else to do it. (To be more precise, it isn't usually the entity but its money that escapes.) The common feature of tax havens is that they offer secrecy. Once the escape has been effected, the escapee is very hard to find. The users of tax havens might be escaping any number of different laws or regulations: taxes, criminal laws, insider trading rules, inheritance rules, environmental laws, or financial regulation. If there is a law to stop or regulate it, there will probably be places that offer escape routes from that law. A simple example of an offshore escape is when a U.S. citizen, say, parks $10 million of drug money in a bank account in Panama. It will be exceedingly difficult for the U.S. authorities to find that money, let alone tax it.

The Elf system allowed bribes to be paid and other nefarious acts to be committed elsewhere—without the paper trails touching French soil. Offshore. The system did not exactly exist anywhere: It flourished in the gaps between jurisdictions. Elsewhere became nowhere.

The Elf affair illustrates another fundamental offshore truth. The escape routes from the rules and laws of society are provided almost exclusively for the benefit of wealthy and powerful insiders—leaving the rest of us to pick up the bill. The Elf system, a gargantuan octopus of corruption, affected ordinary people in both Africa and France in the most profound, if mostly invisible, ways. Ordinary African citizens saw their nations' oil money being siphoned off to the rich world through unfair oil contracts and general corruption, while French protection made Gabon's leaders invulnerable and hence unaccountable to their citizens—at the same time that the Elf system made France's elites unaccountable to that nation's citizens too.

These very same principles apply to the offshore system more generally. Because of tax havens, we have ended up with one set of rules for the rich and powerful and another set of rules and laws for the rest of us—and this applies to citizens of rich and poor countries alike. Just like the Elf system, offshore is a project of elites against their, and our, societies. It is not so much

about crime or taxes, important though they are. This is a story about how political power is distributed in the world today.

It is essential to understand from the outset that the offshore system is ultimately not about celebrity tax exiles and mobsters—though they are regular users of the system. It is about banks and financial services industries. This book will show that the offshore system is the secret underpinning for the political and financial power of Wall Street today. It is the fortified refuge of Big Finance.

The offshore system is also about a more generalized subversion of democracy by our increasingly unaccountable elites. "Taxes are for the little people," the New York millionaire Leona Helmsley once famously said. She was right, though in the end she wasn't big enough to escape prison herself. The media baron Rupert Murdoch is different. His News Corporation, which owns Fox News, MySpace, and any number of other media outlets around the globe, is a master of offshore gymnastics, using all legal means available. When The Economist magazine investigated in 1999, it reckoned that News Corporation paid a tax rate of just 6 percent—compared with 31 percent for its competitor Disney.[8] Neil Chenoweth, an Australian reporter, probed News Corporation's accounts and found that its profits, declared in Australian dollars, were A$364,364,000 in 1987, A$464,464,000 in 1988, A$496,496,000 in 1989, and A$282,282,000 in 1990. [9] The obvious pattern in these numbers cannot be a coincidence. As John Lanchester wrote in the London Reviewof Books: "That little grace note in the sums is accountant-speak for 'Fuck you.' Faced with this level of financial wizardry, all the ordinary taxpayer can do is cry 'Bravo l'artiste!'"

Much of what happens offshore is technically legal. A lot of it is plainly illegal and often criminal. And there is a vast gray area in between. All of it is profoundly dangerous, corrosive to democracy, and morally indefensible. Eva Joly explains what the Elf affair taught her about the distribution of power in the world. "I realized I was no longer confronted with a marginal thing but with a system," she said. "I do not see this as a terrible, multifaceted criminality which is besieging our [onshore] fortresses. I see a respectable, established system of power that has accepted grand corruption as a natural part of its daily business."[10]

From this strange Franco-African tale emerges one more important point, which will be a recurring theme of this book. In decades and centuries past, colonial systems helped rich countries preserve and boost their elites' wealth and privileges at home. When the European powers left their colonies after the Second World War, they replaced

formal controls over their ex- colonies with different arrangements to retain a measure of control behind the scenes. The Elf system was the main way that France achieved this. Britain did it with the modern offshore system, its financial replacement for empire. Citizens of the United States are paying the price.

> "It has taken me a long time to understand," explains Joly, "that the expansion in the use of these jurisdictions [tax havens] has a link to decolonization. It is a modern form of colonialism."[11]

Long before my first visit to Libreville I had noticed how money was pouring out of Africa, often into tax havens, but the secrecy surrounding this financial trade made it impossible to trace the connections. Financial institutions, and occasionally their accountants and lawyers, would surface in particular stories, then slip back into an offshore murk of commercial confidentiality and professional discretion. Every time a scandal broke, these intermediaries' crucial roles escaped serious scrutiny. Africa's problems, the story went, had something to do with its nations' rulers, or its cultures and societies, or the oil companies. It was their fault.

The providers of offshore secrecy were clearly a central part of all these dramas—but the racket was very hard to penetrate, and nobody seemed very interested in trying. It was only in 2005 that the threads properly started to come together for me. I was sitting with David Spencer, a New York attorney previously with Citicorp, talking about transparency in the public finances of West African oil-producing nations. Spencer was getting agitated about matters that were not at all on my agenda: accounting rules, U.S. tax exemptions on interest income, and transfer pricing. I was wondering when he was going to start talking about West African corruption when I finally began to make a serious connection. The United States, by offering tax incentives and secrecy to lure money from overseas, had been turning itself into a tax haven.

Tides of financial capital flow around the world in response to small changes in these kinds of tax and secrecy incentives. The U.S. government needs foreign funds to flow in, and it attracts them by offering tax-free treatment and secrecy. This is offshore business, Spencer explained, and it had become central to the U.S. government's global strategies for financing its deficits. Not only did almost nobody

understand this, he continued, but almost nobody wanted to know. Once, when he gave a speech at a major United Nations event outlining some of these basic principles, a top U.S. negotiator collared him afterward and told him that his shedding light on this subject made him "a traitor to your country." The negotiator was wrong: Spencer was being disloyal only to offshore interests on Wall Street.

In the Harvard Club with Spencer I began to see how the terrible human cost of poverty and inequality in Africa, Latin America, and other parts of the world connected with the apparently impersonal world of accounting and financial regulations and tax law. Africa's supposedly natural or inevitable disasters all had one thing in common: the movement of money out of poor countries and into parts of Europe and the United States, assisted and encouraged by the tax havens and a pinstripe army of respectable bankers, lawyers, and accountants. Nobody wanted to look beyond poor countries at the system that made this movement possible. The U.S. government and many others have allowed tax havens to proliferate because the elites who use them are the world's most powerful lobbyists.

Martin Woods, a Wachovia bank employee who became a whistle-blower after seeing billions of suspect dollars flowing from currency houses in Mexico in the midst of a drug war, illustrates the problem clearly. "If you don't see the correlation between the money laundering by banks and the twenty-two thousand people killed in Mexico," he said, "you're missing the point."[12] The world has, it seems, been determined to miss the point.

The offshore system hadn't been just an exotic sideshow in the stories I was covering, as I had thought. Offshore was the story. It binds together Libreville, Paris, and Jersey; Luanda, Geneva, and Moscow; Moscow, Cyprus, and London; Wall Street, Mexico City, and the Cayman Islands; Washington, the Bahamas, and Riyadh. Offshore connects the criminal underworld with financial elites and binds them together with multinational corporations and the diplomatic and intelligence establishments. Offshore drives conflict, shapes our perceptions, creates financial instability, and delivers staggering rewards to les grands, the people who matter. Offshore is how the world of power now works. This is what I want to show you. The offshore system is the greatest fault line in our globalized world.

An impression has been created in sections of the world's media, since a series of stirring denunciations of tax havens by world leaders in 2008 and 2009, that the offshore system has been dismantled or at least

suitably tamed. As we shall see, exactly the opposite has happened. The offshore system is in robust health—and growing fast. The crackdown has turned out to

be a whitewash.

WELCOME TO NOWHERE
An Introduction to Offshore

THE OFFSHORE WORLD IS ALL AROUND US. Over half of world trade passes, at least on paper, through tax havens. [1] Over half of all bank assets, and a third of foreign direct investment by multinational corporations, are routed offshore.[2] Some 85 percent of international banking and bond issuance takes place in the so-called Euromarkets, a stateless offshore zone that we shall soon explore.[3] Nearly every multinational corporation uses tax havens, and their largest users—by far—are on Wall Street.[4]

Tax havens don't just offer an escape from tax. They also provide wealthy and powerful elites with secrecy and all manner of ways to shrug off the laws and duties that come along with living in and obtaining benefits from society—taxes, prudent financial regulation, criminal laws, inheritance rules, and many others. Offering these escape routes is the tax havens' core line of business. It is what they do.

Before getting into the real story of offshore, this chapter will lay some basic groundwork for understanding tax havens, offering a few essential principles, some brief history, and a short overview of where the tax havens are located.

Nobody agrees exactly what a tax haven is, but I will offer a loose description here: It is a place that seeks to attract money by offering politically stable facilities to help people or entities get around the rules, laws, and regulations of jurisdictions elsewhere.[5] This definition is quite broad, compared to some others, and I have chosen it for two main reasons. First, I aim to challenge a common idea that it is perfectly OK for one jurisdiction to exercise its sovereign right to get rich by undermining the sovereign laws and rules of other places. Second, I am

offering a lens through which to view the history of the modern world. This definition will help me show how the offshore system is not just a colorful appendage at the fringes of the global economy but rather lies at its very center.

I should also make a short point here about some confusion in the language. When I say “offshore,” I obviously am not referring to offshore oil drilling. I am also not talking about “offshoring,” which is what happens when a company moves a manufacturing plant or, say, a call center from the United States to India or China, perhaps to save on labor costs. When I say “offshore,” I am talking about the artificial movement or use of money across borders, and about the jurisdictions, commonly known as tax havens, that host and facilitate this activity. Once the money has escaped offshore, it is reclassified in an accountant’s ledger and it assumes a different identity—and that means, very often, that the forces of law and order will never find it.

A number of features help us spot tax havens. Here are some important ones.

First, as my colleagues have found through painstaking research, all tax havens offer secrecy, in various forms. The term secrecy jurisdiction emerged in the United States in the late 1990s, and in this book I will use it interchangeably with tax haven. I will call the whole global structure of these places, and the private infrastructure that services them, the offshore system.

Another common marker for tax havens is very low or zero taxes, of course. People and corporations use them to escape tax, legally or illegally. Secrecy jurisdictions also have very large financial services industries in comparison to the size of the local economy. These places also routinely “ring-fence” their own economies from the facilities they offer to protect themselves from their own offshore tricks. So they might, for example, offer a zero tax rate to nonresidents who park their money there but tax local residents fully. This ring-fencing is a tacit admission that what they do is harmful.

Various other telltale signs exist. Tax havens usually deny what they are and strenuously assert that they are clean. Search for “We are not a tax haven” on the Internet or “We are a transparent, well regulated, and cooperative jurisdiction,” and see what comes up. Each has its own way of addressing the critics: In the Cayman Islands, for example, accusations of lax regulation after scandals are routinely dismissed as media stereotypes that do not correspond to objective reality.[6]

But there is one feature of a secrecy jurisdiction that stands out above

all: that local politics is captured by financial interests from elsewhere (sometimes these financial interests are criminal interests). This is why I include "politically stable" in my definition: Meaningful opposition to the offshore business model will have been neutered in a serious tax haven, so that such irritants as local politics cannot interrupt the business of making money. And here lies one of the great offshore paradoxes: These zones of ultra-freedom for financial interests are so often repressive places, viciously intolerant of criticism. The offshore world is steeped in a pervasive inverted morality: Turning a blind eye to crime and corruption has become good business practice: a way of attracting money; while alerting forces of law and order to wrong-doing has become the punishable offense. Here in the tax havens, rugged individualism has morphed into a disregard, even a contempt, for democracy and for societies at large.

One of the first things to understand about offshore business is that it is, at heart, about artificially manipulating paper trails of money across borders. To get an idea of how artificial it can be, consider the banana.

A bunch of bananas typically takes two routes into your home: a real route and an artificial offshore paper trail. On the first route a Honduran worker, say, is employed by Big Banana, a U.S. multinational I've just invented, to pick the bananas, which are then packaged and shipped to Britain, sold to a supermarket, and sold on to a customer.

The second route—the accountants' paper trail—is different. When a banana is picked in Honduras and shipped to Britain and sold, where are the final profits generated? In Honduras? In the British supermarket? In the multinational's U.S. head office? And how do you work this out? How much do the corporation's management expertise, or the brand name, or the insurance, or the accounting business, contribute to profits and costs? Which country ought to tax each component of the final

profit? Nobody can say for sure, so the accountants can, up to a point, decide for themselves.

Here, in simple form, is what they might do. They advise Big Banana to run its purchasing network from, say, the Cayman Islands, and put a financial services subsidiary in Luxembourg. The Big Banana brand might be parked in Ireland; its shipping subsidiary in the Isle of Man; it might locate certain parts of its "management expertise" in Jersey, and its insurance arm in Bermuda. All are tax havens.

Next, each part of this multinational charges the other parts for the services they provide. So Big Banana's Luxembourg finance subsidiary might lend money to Big Banana Honduras, then charge that Latin American subsidiary $10 million per year in interest payments for that loan. The Honduran subsidiary will deduct this $10 million from its local profits, cutting or wiping out its local profits (and consequently its tax bill) there. The Luxembourg finance subsidiary, however, will record this $10 million as income—but because Luxembourg is a tax haven, it pays no taxes on this. With a wave of an accountant's wand, a hefty tax bill has disappeared. Who is to say that the $10 million charged by Big Banana Luxembourg is the real going rate—or just an accountant's invention? Quite often it is hard to tell, although sometimes these prices are adjusted so aggressively that they lose all sense of reality: A kilo of toilet paper from China has been sold for $4,121.81, a liter of apple juice has been sold out of Israel at $2,052, and a ballpoint pen has been recorded leaving Trinidad valued at $8,500.

Though most examples are far less blatant than this, the cumulative total of these shenanigans is vast. About two-thirds of global cross-border world trade happens inside multinational corporations. And it is poor countries in particular, with their underpaid tax officials, that always lose out to multinationals' aggressive, highly paid accountants.

What Big Banana has done here is transfer pricing (or mispricing), a common offshore trick that U.S. Senator Carl Levin calls "the corporate equivalent of the secret offshore accounts of individual tax dodgers." The general idea is that by adjusting its internal prices a multinational can shift profits offshore, where they pay little or no tax, and shift the costs onshore, where they are deducted against tax. In the banana example, tax revenue has been drained out of a poor country and into a tax haven and funneled through to the wealthy owners of a multinational corporation. In October 2010 a Bloomberg reporter explained how Google Inc. cut its taxes by $3.1 billion in the previous three years through transfer pricing games known by names such as the "Double Irish" and

"Dutch Sandwich," ending up with an overseas tax rate of 2.4 percent.[7] The problem is getting worse. Microsoft's tax bill has been falling sharply, for similar reasons. Cisco is at it.[8] They are all at it. Transfer pricing alone cost the United States an estimated $60 billion a year[9]—and that is just one form of the offshore tax game.

Worldly readers may still shrug and tell themselves that this is just part of the ugly flipside of living in a rich nation. If they do, in their reluctantly cynical way, they are suckers—for they are victims, too. The tax bill is cut not only in Honduras but in Britain and America too. The annual report of a real banana company listed in New York notes: "The company currently does not generate U.S. federal taxable income. The company's taxable earnings are substantially from foreign operations being taxed in jurisdictions at a net effective rate lower than the U.S. statutory rate."[10] (Rough translation: We don't currently pay U.S. taxes because we use tax havens.)

This may be quite legal—but when it happens, small businesses and ordinary folk must step in to pay the taxes that multinationals have escaped. "Small businesses are the lifeblood of local economies," said Frank Knapp, member of a new group formed in 2010 called Business and Investors Against Tax Haven Abuse. "We pay our fair share of taxes, shop locally, support our schools, and actually generate most of the new jobs. So why do we have to subsidize multinationals that use offshore tax havens to avoid paying taxes?"

Multinationals, it has to be said, find it hard to cut their taxes to zero because governments take countermeasures. But it is a battle the governments are losing. The U.S. Government Accountability Office reported in 2008 that two-thirds of American and foreign companies doing business in the United States avoided income tax obligations to the federal government in the years 1998–2005, despite corporate sales totaling $2.5 trillion.[11] Not only this, but the corporate transfer pricing abuses that I have just described are just one of several forms of tax abuse. Subsequent studies suggest the problem is getting worse.[12]

Transfer mispricing is one of the most important reasons that multinationals are multinationals and why they usually grow faster than smaller competitors. Anyone worried about the power of global multinationals should pay attention to tax havens.

It is not just your bananas, of course. Much of the food you eat will most likely have taken a similarly twisted route into your home. The

water in your tap may have traveled on a similarly ghostly paper pathway en route to your bathtub. Your television, its component parts, and many of the programs it shows also likely took offshore routes into your living room. The offshore world envelops us.

All these offshore games make markets profoundly inefficient. Wealth has been transferred from poor taxpayers to rich shareholders—but nobody has produced a better or cheaper banana here. These are untargeted government subsidies for multinationals, courtesy of the tax havens, and they don't make multinationals more productive. When corporate managers focus on tax dodging they take their eyes off what they do best—making better goods and delivering them more cheaply to market. Add to that the time and billions wasted paying expensive accountants and lawyers to conjure up these schemes. And then there is the secrecy. A fundamental building block of modern economic theory is transparency: Markets work best when two sides to a contract have access to equal information. Treasure Islands explores a system that works directly and aggressively against transparency. Offshore secrecy shifts control over information and the power that flows from it toward the insiders, helping them take the cream and use the system to shift the costs and risks onto the rest of society.

David Ricardo's theory of comparative advantage elegantly describes principles that lead different jurisdictions to specialize in certain things: fine wines from France, cheap manufactures from China, and computers from the United States. But when we find that the British Virgin Islands, with fewer than twenty-five thousand inhabitants, hosts over eight hundred thousand companies, or that more than 40 percent of foreign direct investment into India comes from Mauritius, Ricardo's theory loses its traction. Companies and capital migrate not to where they are most productive but to where they can get the best tax break. There is nothing "efficient" about any of this.

The world contains about 60 secrecy jurisdictions, or tax havens, which can be divided roughly into four groups: a set of continental European havens, a British zone of influence centered on the City of London and loosely shaped around parts of Britain's former empire, a zone of influence focused on the United States, and a fourth category holding unclassified oddities like Somalia and Uruguay.

The European havens got going properly from the First World War, as

governments raised taxes to pay for their war costs. Switzerland's famous secrecy law, making violation of banking secrecy a criminal offense for the first time, was enacted in

1934 in response to a French tax evasion scandal, though Geneva bankers had sheltered the secret money of European elites since at least the eighteenth century.[13] Picturesque, little-known Luxembourg, specializing since 1929 in certain kinds of offshore corporations,[14] is among the world's biggest tax havens today: Well over $2.5 trillion is parked offshore in Luxembourg.[15] In March 2010 South Korean intelligence officials indicated that North Korea's "Dear Leader" Kim Jong-Il had stashed some $4 billion in Europe—profit from the sale of nuclear technology and drugs, insurance fraud, counterfeiting, and projects using forced labor; Luxembourg, they said, is a favored destination for the money.[16]

The Netherlands is another major European tax haven. In 2006, while the Irish musician Bono browbeat Western taxpayers to boost aid to Africa, his band, U2, shifted its financial empire to the Netherlands to cut its own tax bills. Austria and Belgium are also important European havens of banking secrecy, though Belgium softened its laws in 2009. A couple of other small European micro-state havens are worth noting, including Monaco and Andorra, with occasional cameo roles from odd places like the Portuguese Islands of Madeira, which was central to a major Nigerian bribery scandal involving the U.S. oil service company Halliburton[17] that resulted in the second largest fine ever paid in a prosecution under the Foreign Corrupt Practices Act.

The second offshore group, accounting for about half the world's secrecy jurisdictions, is the biggest. This is a layered hub-and- spoke array of tax havens, centered on the City of London, which mostly emerged from the ashes of the British empire.[18] As I will show, it is no coincidence that the City of London, once the capital of the greatest empire the world has known, is the center of the most important part of the global offshore system.

The City's offshore network has three main layers. Its inner ring consists of Britain's three Crown Dependencies: the nearby islands of Jersey, Guernsey, and the Isle of Man. The authoritative U.S. publication Tax Analysts estimated conservatively in
2007 that just these three havens hosted about $1 trillion of potentially tax- evading assets.[19] At a reasonable annual rate of return of 7 percent and a top income tax rate of 40 percent, the tax evaded on those could

be almost $30 billion per year—and income tax evasion is just one of several forms of offshore tax and financial losses. Other losses, which I will explain below, are far bigger.

The next, intermediate ring involves Britain's 14 overseas territories, the last surviving outposts of Britain's formal empire. With just a quarter of a million inhabitants between them, they include some of the world's top secrecy jurisdictions: the Cayman Islands, Bermuda, the British Virgin Islands, Turks and Caicos, and Gibraltar. [20] Like the Crown Dependencies, these places are partly independent from Britain—though Britain controls events behind the scenes. In the Caymans, for instance, Her Majesty the British Queen appoints His Excellency the Governor, the most powerful person on the island. He (never a she, so far) presides over a cabinet of local Caymanians who are elected locally but who have almost no power over the stuff that matters—the money. The governor handles defense, internal security, and foreign relations; he appoints the police commissioner, the complaints commissioner, the auditor general, the attorney general, the judiciary, and other top officials. The final appeal court is the Privy Council in London. MI6, Britain's Secret Intelligence Service, is highly active here[21] (as are the CIA and several other intelligence services).

The Cayman Islands is the world's fifth largest financial center, hosting eighty thousand registered companies, over three- quarters of the world's hedge funds, and $1.9 trillion on deposit—four times as much as in all the banks in New York City. And it has, at the time of writing, one cinema.

To indicate how murky things are here, the Cayman Islands reported in 2008 that institutions based there had $2.2 trillion in borrowings but had only lent out a third of that amount—even though these figures should match each other, more or less. The UK and Caymans authorities have not explained this $1.5 trillion discrepancy.[22]

The third, outer ring is a more diverse array of havens like Hong Kong and the Bahamas, which are outside Britain's direct control but nevertheless have strong historical links to the empire and deep current links to the City of London. One authoritative account estimates that this three-layered British grouping accounts for well over a third of all international bank assets worldwide. Adding the City of London itself brings the total up to nearly a half.[23]

This network of offshore satellites does several things for the City of London. First, it gives it a global reach: These havens scattered around the world attract and catch mobile international capital flowing to and

from nearby jurisdictions, just as a spider's web catches passing insects. Money attracted to these jurisdictions, and much of the business of managing that money, is funneled through to London. A lot of U.S. business is attracted to the Cayman Islands, and this gives the City of London the chance to get a slice of the action. Second, the spiderweb[24] lets the City get involved in business that might be forbidden in Britain, giving the financiers in London sufficient distance from wrongdoing to allow plausible deniability. By the time the money gets to London, often via several intermediary jurisdictions, it has been washed clean. The old City of London adage "Jersey or Jail" means that if you want to do a certain type of business but don't want to get caught, you just step out into the Jersey part of the spiderweb and do it there. Sometimes, business too dirty for the Crown Dependencies is farmed out further into the spiderweb. John Christensen, formerly a Jersey financial sector professional, remembers the Overseas Territory of Gibraltar being one particular favorite. "We in Jersey regarded Gibraltar as totally subprime," he said. "This was where you put the real monkey business." Later, a Caymanian character who introduced himself to me only as "The Devil" will help illustrate just how dirty this business can be.

Britain's understated, ambiguous, but ultimately controlling role in these nodes of the spiderweb is the bedrock that reassures flighty global capital and underpins their offshore sectors. The gesture toward local representation keeps Caymanians happy and gives Britain the chance to say "it is not our business to interfere" when something unpleasant breaks the surface, or when other countries complain of abuses being perpetrated out of there. Periodically, the charade of the overseas territories is exposed: In August 2009 Britain imposed direct rule in the Turks and Caicos Islands after corruption there spun too far out of control.[25] Britain plays down these episodes, as far as is possible, to distract attention away from its real control.

The outer reaches of the British spiderweb consist of a more complex and varied set of places that are independent from Britain, but with a history of involvement with the British empire or zones of close influence, and with enduring and powerful links with the City of London. The biggest are Hong Kong, Singapore, the Bahamas, Dubai, and Ireland,[26] though many others exist, like Vanuatu in the South Pacific, whose small offshore center was created by the British government in 1971, nine years before independence. New ones continue to emerge: In February 2006, for example, Ghana said it would set up offshore

legislation with help from Britain's Barclays Bank. The thought of a new African secrecy jurisdiction in the midst of a swath of

legendarily corrupt African oil-producing nations—and just as Ghana takes its own first steps as a big oil producer—is almost too horrible to contemplate. Botswana, right next to South Africa, is setting up its offshore center too.

One might ask why the United States has more or less tolerated the presence of British-run places parked off its eastern and southern coastline, eroding its tax base and undermining its laws and financial regulations. The answer isn't straightforward. U.S. officials have periodically tried to crack down on offshore tax abuse, at least since 1961, when President Kennedy asked Congress for legislation to drive these tax havens "out of existence,"[27] but have been thwarted each time by powerful interests on Wall Street. A U.S. Government Accountability Office (GAO) report from December 2008 provides a clue as to their power, showing that Citigroup had 427 tax haven subsidiaries, of which 290 were in the British spiderweb. The next biggest user was Morgan Stanley with 273 offshore subsidiaries (of which 220 were in the British zone), then News Corporation with 152, of which 140 were in the British zone.[28]

In these numbers lies another important point to understand from the outset. People have traditionally seen tax havens as marginal players used by mafiosi, drug smugglers, spies, petty criminals, and celebrity tax-dodgers. Plenty of these can be found offshore, it is true.[29] But I need to stress again: The big users of the secrecy jurisdictions are the banks and other financial institutions.

I am struck by similarities between Britain's postcolonial offshore network and what I encountered in oil-rich Gabon, the epicenter of France's own very strange, quasi-offshore postcolonial system. Gabon fits no conventional definition of a tax haven, but it is, like the havens in the British spiderweb, a relic (or even a rebirth) of a colonial empire that is being used by elites to do things—often unpleasant ones—that would not be allowed at home. The Elf system, with its subterranean bargains with African rulers and French politicians, was a way for France to retain a great degree of control over its former colonies after independence. Britain's spiderweb is different—most of its former colonies in Africa, India, and elsewhere really are independent. But what Britain has done instead is to retain a large degree of control of the vast flows of wealth in and out of these places, under the table. Illicit capital flight from Africa, for example, flows mostly into the modern British spiderweb, to be managed in London. In both the French and the British systems, powerful interest groups in the old colonial powers have built

secret financial relationships with the local elites, creating global alliances with each other against the ordinary citizens of these poor countries—and against their own citizens too.

The United States anchors the third big offshore pole. Before the great global offshore explosion began in the 1960s and the 1970s, the U.S. government was generally hostile to offshore business, and its leaders fought against the British spiderweb and the European havens. But as the 1970s wore on financial interests became increasingly influential in U.S. policymaking, and the country, facing large Vietnam War–era deficits and increasingly adopting an "if you can't beat 'em, join 'em" attitude toward tax havens, began consciously adopting its own offshore characteristics—particularly special tax incentives and secrecy structures available to foreigners—in efforts to attract financial capital into the United States to fill the deficits.

So there are two things going on here: Tax revenues and other money are being drained out of the United States into tax havens elsewhere, and a flow of foreign (often dirty) money is moving in the other direction back into the country. The United States is estimated to be losing $100 billion annually from offshore tax abuses—a gigantic transfer of wealth from ordinary taxpayers to rich people.[30] And that is not to mention the role the offshore system plays as a giant hothouse for international crime and fraud or its role in undermining financial regulation, which I shall get to.

But the money flowing into tax haven USA does not make up for the money and tax revenues being drained out. The inflows have made matters worse still for ordinary U.S. taxpayers, let alone for foreigners being stiffed by their own wealthy and unaccountable elites. As the following chapters will show, the inflows delivered massive rewards to a small financial elite, while helping Wall Street to gain its too-big-to-fail stranglehold on the U.S. economy and the politicians in Washington. "Tax havens are engaged in economic warfare against the United States, and honest, hardworking Americans," says Senator Carl Levin. He is quite right—but we should add that the United States in its role as a tax haven is conducting economic warfare against honest, hardworking people at home and around the world.

Like the British offshore system, the U.S.-based offshore system operates on three tiers.

At the federal level, on the top tier, the United States dangles a range of special tax exemptions, secrecy provisions, and laws designed to attract foreigners' money into the United States in true offshore style. U.S. banks may, for instance, legally accept proceeds from a range of crimes, such as handling stolen property—as long as the crimes are committed overseas. Special arrangements are made with banks to make sure they do not reveal the identities of foreigners parking their money in the United States.

The second offshore tier involves individual U.S. states. A range of different things are happening, in a number of states. Florida, for example, is where Latin American elites do their banking, and the United States generally does not share banking information with those countries, so a lot of this is tax-evading and other criminal money, protected by U.S. secrecy. Florida's banks also have a long history of harboring Mob and drug money, often in complex partnerships with the nearby British Caribbean havens. On a different tack, smaller U.S. states like Wyoming, Delaware, and Nevada have become specialists in offering low-cost and very strong forms of almost unregulated corporate secrecy, which has attracted illicit money, and even terrorist money, from around the globe.

The third U.S. offshore rung is an overseas satellite network, far smaller than the British zone. One is the U.S. Virgin Islands, a U.S. "Insular Area" and a minor haven used by Bank of America, Boeing, FedEx, and Wachovia, among others. [31] A more interesting haven in the U.S. zone is the Marshall Islands, a former Japanese colony under U.S. control since 1947, now under a Compact of Free Association with the United States. It is primarily the host for a "flag of convenience" service that, The Economist magazine recently noted, is "much prized among shipowners for its light regulatory touch." The Marshall Islands registry was set up in 1986 with USAID help by Fred M. Zeder II, a golfing buddy of George H. W. Bush who later ran the United States Overseas Private Investment Corp. (OPIC), and its flag of convenience service is run by a private U.S. corporation out of offices in Reston, Virginia, near Washington Dulles Airport. The Marshall Islands provides the anything-goes, unregulated flag for, among many others, the Deepwater Horizon, the BP-operated oil rig that caused environmental chaos off the U.S. Gulf Coast in 2010.[32]

A small, opaque tax haven also grew alongside the Marshall Islands shipping registry, which the GAO reckoned was being used by ConocoPhilips, Morgan Stanley, and News Corp. When Khadija

Sharife, a South African journalist, posed as a shipping client pretending to be worried about disclosure, she was told that forming a Marshall Islands company could be done

in a day for an initial filing fee of $650 plus annual fees of $450, and

> If the authorities . . . come to our Registry and Jurisdiction and ask to disclose more information, regarding shareholders, directors of the company etc.… we are not privy to that information anyway, since all the business organization and conduct of the entity is performed by the entity's lawyers and directors directly. Unless the name of directors and shareholders are filed in the Marshall Islands and become a public record (which is NOT mandatory), we are not in a position to disclose that information.[33]

In Africa, Liberia was set up in 1948 as a "flag of convenience" by Edward Stettinius Jr., a former U.S. secretary of state, and its maritime code was "read, amended, and approved by officials of Standard Oil," according to the historian Rodney Carlisle. Its sovereign shipping registry is now run by another private U.S. corporation out of Vienna, Virginia, about five miles from the Marshall Islands registry.[34] Sovereignty is, literally, available for sale or rent in such places.

The biggest tax haven in the U.S. zone of influence is Panama. It began registering foreign ships from 1919 to help Standard Oil escape U.S. taxes and regulations, and offshore finance followed: Wall Street interests helped Panama introduce lax company incorporation laws in 1927, which let anyone open tax-free, anonymous, unregulated Panama corporations with few questions asked. "The country is filled with dishonest lawyers, dishonest bankers, dishonest company formation agents and dishonest companies," one U.S. Customs official noted. "The Free Trade Zone is the black hole through which Panama has become one of the filthiest money laundering sinks in the world."[35]

This strange and little-known U.S.-centered pattern, echoing the neocolonial role of the secrecy jurisdictions in the British zone, provides a pointer to the fact that the secrecy jurisdictions have for years quietly been at the heart of neoconservative schemes to project U.S. power around the globe. And almost nobody has noticed.

It should be clear by now that the offshore world is not a bunch of independent states exercising their sovereign rights to set their laws and tax systems as they see fit. It is a set of networks of influence

controlled by the world's major powers, notably Britain, the United States, and some jurisdictions in Europe. Each network is deeply interconnected with, and warmly welcomes offshore business from, the others. Wealthy U.S. individuals and corporations use the British spiderweb extensively: Enron, for example, had 881 offshore subsidiaries before it went bust, of which 692 were in the Cayman Islands, 119 in the Turks and Caicos, 43 in Mauritius, and 8 in Bermuda, all in the British spiderweb. The United States returns the favor to wealthy British interests investing tax-free, in secrecy, via Wall Street.

Not only that, but the world's most important tax havens in their own right are not exotic palm-fringed islands but some of the world's most powerful countries themselves. Marshall Langer, a prominent supporter of secrecy jurisdictions, neatly describes the misperceptions that have grown up about tax havens. "It does not surprise anyone when I tell them that the most important tax haven in the world is an island," he said. "They are surprised, however, when I tell them that the name of the island is Manhattan. Moreover, the second most important tax haven in the world is located on an island. It is a city called London in the United Kingdom."[36]

Jason Sharman, an Australian academic, checked how easy it was to set up secrecy structures, using the Internet and those seedy offshore advertisements that infest the back pages of business publications and airline magazines. In his report published in 2009 he records making forty-five bids for secret front companies. Money laundering controls seem to be in operation patchily, but of those 45 bids, 17 companies agreed to set them up without even checking his identity. Only four of these were in the "classic" havens like Cayman or Jersey, while the other 13 were in countries from the wealthy Organisation for Economic Cooperation and Development (OECD), including seven in Britain and four in the United States.

What Sharman was encountering, The Economist magazine noted, was not traditional Swiss banking secrecy, where discreet men in plush offices promised to take their clients' names to the grave. "This is a more insidious form of secrecy, in which authorities and bankers do not bother to ask for names…. For shady clients, this is a far better proposition: what their bankers do not know, they can never be forced to reveal. And their method is disarmingly simple. Instead of opening bank accounts in their own names, fraudsters and money launderers form anonymous companies, with which they can then open bank

accounts and move assets."[37] The United States, Sharman noted, was offering nonresident foreigners all the elements of a tax haven, notably no taxes and secrecy. As he put it, "The United States, Great Britain and other OECD states have chosen not to comply with the international standards which they have been largely responsible for putting in place."

Rich OECD nations have worked hard to persuade their publics that there has been a major crackdown on the secrecy jurisdictions. "The old model of relying on secrecy is gone," said Jeffrey Owens, head of tax at the OECD. "This is a new world, with better transparency and better cooperation."[38] Many people believed him. French president Sarkozy went further. "Tax havens and bank secrecy," he said, "are finished."[39] Yet big OECD member states are the guardians and promoters of the offshore system. It continues to process vast tides of illicit money—yet an OECD blacklist of tax havens is effectively a whitewash, as I will explain later.[40] And to the very, very limited extent that rich countries have tried to address the problem, low- income countries are being left on the sidelines as usual.

When the fox announces that it has done an excellent job of beefing up the security of the henhouse, we should be very cautious indeed.

The offshore world is an endlessly shifting ecosystem, and each jurisdiction offers one or more offshore specialties. Each attracts particular kinds of financial capital, and each develops a particular infrastructure of skilled lawyers, accountants, bankers, and corporate officers to cater to their specific needs.

Yet few people are even aware that such businesses exist. You may well have heard of the Big Four accounting firms KPMG, Deloitte, Ernst & Young, and PricewaterhouseCoopers. But have you heard of the Offshore Magic Circle? Its members are made up of highly profitable multijurisdictional law firms mostly originating in Britain or its Overseas Territories and Crown Dependencies: a smartly dressed regiment of accountants, lawyers, and bankers forming a private global infrastructure that, in league with captured legislatures in the secrecy jurisdictions, makes the whole system work.

Offshore services range from the legal to the illegal, with a huge gray area in between. In terms of tax, the illegal stuff is called tax evasion, while tax avoidance is technically legal, though, by definition, it also involves getting around the intent of elected legislatures. To distinguish

between evasion and avoidance is a slippery business, and it often takes vast, lengthy court cases to find out which side of the law a multinational corporation's tax shelter lies on. Former British chancellor Dennis Healey gave a

neat definition of where the dividing line lies. “The difference between tax avoidance and tax evasion,” he said, “is the thickness of a prison wall.”[41] Even when offshore is not technically illegal, it is often a problem. Secrecy jurisdictions routinely convert what
is technically legal, but abusive, into what is seen as legitimate. Of course what is legal is not necessarily what is right: think slavery, or apartheid.

Illegal offshore services and structures include tax-evading private banking or asset management, sham trusts, corporate secrecy, illegal reinvoicing, regulatory evasion, fraud concealment, and many, many other nefarious possibilities. These are often hidden behind soothing bromides like “tax optimization” or “asset protection” or “efficient corporate structure.”

On the tax side, one important matter concerns something known as double taxation. Say a U.S. multinational invests in a manufacturing plant in Brazil and earns income there. If both countries taxed the same income, without giving credits for the other country’s taxes, the multinational would get taxed twice. Tax havens do help companies eliminate this double taxation— though you don’t need tax havens for this: It can be ironed out with appropriate treaties and tax credits between countries. But when tax havens eliminate double taxation, something else happens too: double nontaxation. In other words, not only does the corporation avoid being taxed twice on the same income. It also avoids being taxed at all. I will explore this strange and complex area in a little more detail later.

Each jurisdiction tolerates different levels of dirt. Terrorists or Colombian drug smugglers would probably use Panama, not Jersey— though Jersey’s trust company sector in particular, handling several hundreds of billions of dollars’ worth of assets, continue to make the island a sink for nefarious activity and illicit, tax-evading loot, notwithstanding Jersey’s routine claims to be a “transparent, well-regulated and cooperative jurisdiction.” Bermuda is a magnet for offshore insurance and reinsurance, frequently for the purpose of avoiding tax; the Caymans are favored locations for hedge funds, frequently for the purposes of escaping tax, legally or illegally, but more often to get around certain kinds of financial regulation. In securitization, the practice of packaging up mortgage loans and other assets to sell on to investors—a major contributor to the latest financial crisis—Wall Street has long favored locating its Special Purpose Vehicles (SPVs) in the Caymans and Delaware; in Europe the preferred locations for SPVs

are Jersey, Ireland, Luxembourg, and the City of London. All are, as this book will show, major secrecy jurisdictions.

Tax havens often target specific other large economies, usually nearby. Switzerland's wealth managers focus quite heavily on getting business from tax-evading rich Germans, French, and Italians—corresponding to Switzerland's immediate neighbors and to Switzerland's three main language groups—though they are open to all comers from around the world. Monaco caters especially to French elites, while some wealthy French and Spaniards use Andorra, sandwiched in the eastern Pyrenees between the two larger countries. Rich Australians often use Pacific havens like Vanuatu; a lot of illicit North African money finds itself routed through Malta, another former British outpost in the Mediterranean Sea. U.S. and Latin American corporations and wealthy individuals use Panama and the Caribbean havens for a lot of their business, while wealthy Chinese tend to use Hong Kong, Singapore, and Macau.

Some jurisdictions specialize as conduit havens: way stations offering services that transform the identity or character of assets in specific ways, en route to somewhere else. The Netherlands is a big conduit haven: About €4.5 trillion (US $6.6 trillion) flowed through Dutch Special Financial Institutions in 2008—equivalent to over nine times the Dutch GDP. [42] Mauritius, off the African coast in the Indian Ocean, is a new and fast-growing conduit haven that is the source of over 40 percent of foreign investment into India. It also specializes in channeling Chinese investments into Africa's mineral sectors. Money does not always flow through obvious geographical routes, however: Russian dirty money has favored Cyprus, Gibraltar, and Nauru, all with strong historical British links, as stepping-stones where it can be legitimized before entering the mainstream global financial system in London and elsewhere. A large amount of foreign investment into China goes via the British Virgin Islands.

Offshore financial structures typically involve a trick sometimes known as laddering—a practice also expressed by the French word saucissonage, meaning to slice something into pieces like a sausage. When you slice a structure among several jurisdictions, each provides a new legal or accounting "wrapper" around the assets that can deepen the secrecy and the complexity protecting the assets. A Mexican drug dealer may have $20 million, say, in a Panama bank account. The account is not in his name but is instead under a trust set up in the Bahamas. The trustees may live in Guernsey, and the trust beneficiary

could be a Wyoming corporation. Even if you can find the names of that company's directors, and even get photocopies of their passports—that gets you no closer: These directors will be professional nominees who direct hundreds of similar companies. They are linked to the next rung of the ladder through a company lawyer, who is prevented by attorney-client privilege from giving out any details. Even if you break through that barrier you may find that the corporation is held by a Turks and Caicos trust with a flee clause: The moment an inquiry is detected, the structure flits to another secrecy jurisdiction. Even if a jurisdiction cooperates with inquiries, it can drag its feet for months or years. "Even when they cooperate to eliminate the fraud," Robert Morgenthau, until recently the Manhattan district attorney, said of the Caymans, "it takes so long that when the door is finally closed, the horse has been stolen and the barn has burned down."[43] At the time of writing, Hong Kong is preparing legislation to allow incorporation and registration of new companies within minutes.

In 2010 Luxembourg's authorities pleaded this laddering as an excuse for potentially harboring North Korean money. "The problem is that they do not have 'North Korea' written all over them," a spokesman said. "They try to hide and they try to erase as many links as possible."[44] That is, after all, the point. Magistrates in France only ever saw a limited part of the Elf system because of this saucissonage. "The magistrates are like sheriffs in the spaghetti westerns who watch the bandits celebrate on the other side of the Rio Grande," wrote the magistrate Eva Joly, furious about how tax havens stonewalled her probes into the Elf system. "They taunt us—and there is nothing we can do."

Even if you can see parts of the structure, the laddering stops you from seeing it all—and if you can't see the whole, you cannot understand it. The activity doesn't happen in any jurisdiction—it happens between jurisdictions. "Elsewhere" becomes "nowhere": a world without rules.

I already mentioned some ballpark numbers suggesting how big the offshore system has become: half of all banking assets, a third of foreign investment, and more. But there have been very few attempts to quantify the damage that this system causes. This is partly because it is so hard to measure, let alone detect, secret, illicit things. But it is also because nobody wants to know.

Recently, however, a few organizations have sought to assess the problem's scale. In 2005 the Tax Justice Network estimated that wealthy individuals hold perhaps $11.5 trillion worth of wealth offshore. That is about a quarter of all global

wealth and equivalent to the entire GDP of the United States. That much money in hundred-dollar bills, placed end to end, would stretch twenty-three times to the moon and back. The estimated $250 billion in taxes lost each year on the income that money earns is two to three times the size of the entire global aid budget to tackle poverty in developing countries.

But that sum just represents the taxes lost on money wealthy individuals hold offshore. A much bigger transfer of wealth is occurring through illicit financial flows across borders from developing countries into secrecy jurisdictions and rich countries. The most comprehensive study of this comes from Raymond Baker's Global Financial Integrity (GFI) Program at the Center for International Policy in Washington. Developing countries, GFI estimated in January 2011, lost a staggering $1.2 trillion in illicit financial flows in 2008—losses that had been growing at 18 percent per year since 2000.[45] Compare this to the $100 billion in total annual foreign aid, and it is easy to see why Baker concluded that "for every dollar that we have been generously handing out across the top of the table, we in the West have been taking back some $10 of illicit money under the table. There is no way to make this formula work for anyone, poor or rich." Remember that the next time some bright economist wonders why aid to Africa is not working. We are clearly talking about one of the great stories of our age.

In a separate study subsequently endorsed by the World Bank,[46] Baker estimated that only about a third of total illicit cross- border flows represent criminal money—from drug smuggling, counterfeit goods, racketeering, and so on. Corrupt money— local bribes remitted abroad or bribes paid abroad—added up to just 3 percent of the total. The third component, making up two-thirds, is cross-border commercial transactions, about half from transfer pricing through corporations. His research underlines the point that illicit offshore flows of money are far less about the drug smugglers, mafiosi, celebrity tax exiles, and fraudsters of the popular imagination and mostly about corporate activity.

And out of this emerges another profoundly important point. The drug smugglers, terrorists, and other criminals use exactly the same offshore mechanisms and subterfuges—shell banks, trusts, dummy corporations, and so on—that corporations use. "Laundered proceeds of drug trafficking, racketeering, corruption, and terrorism tag along with other forms of dirty money to which the United States and Europe lend a welcoming hand," said Baker. "These are two rails on the same tracks through the international financial system." We will never beat the

terrorists or the heroin traffickers unless we confront the whole system—and that means tackling the tax evasion and avoidance and financial regulation and the whole paraphernalia of offshore. It is hardly surprising, in this light, that Baker estimates that the U.S. success rate in catching criminal money was 0.1 percent— meaning a 99.9 percent failure rate.

And that is only the illegal stuff. The legal offshore tax avoidance by individuals and corporations, which further gouges honest hardworking folks, adds hundreds of billions of dollars to these figures.

Almost no official estimates of the damage exist. The Brussels-based nongovernmental organization Eurodad has issued a limited-edition book called Global Development Finance: Illicit Flows Report 2009, which seeks to lay out, over a hundred pages, all of the comprehensive official estimates of global illicit international financial flows.[47] Every page is blank.

Eurodad's gimmick underscores a vital point: There has been an astonishing blindness on the part of the world's most powerful institutions to this system that has effected the greatest transfer of wealth from poor to rich in the history of the planet. As the sociologist Pierre Bordieu once remarked, "The most successful ideological effects are those which have no need for words, and ask no more than complicitous silence."

Language itself encourages the blindness. In September 2009, the G20 group of countries pledged in a communiqué to "clamp down on illicit outflows." Now consider the word outflows. Like the term capital flight, it points the finger at the victim countries like Congo or Nigeria or Mexico—which, this language subtly insists, must be the focus of the cleanup. But each flight of capital out of a poor country must have a corresponding inflow somewhere else. Imagine how different that pledge would be if the G20 had promised to tackle "illicit inflows."

Bad tax systems are pushing some nations toward becoming failed states. "Countries that will not tax their elites but expect us to come in and help them serve their people are just not going to get the kind of help from us that they have been getting," Hillary Clinton said in September 2010, to widespread and bipartisan applause. "Pakistan cannot have a tax rate of 9 percent of GDP when land owners and all of the other elites do not pay anything or pay so little it's laughable, and then when there's a problem everybody expects the United States and others to come in and help."[48] Leave aside for a moment the hypocrisy involved when the United States preaches to developing

countries about abusive tax systems while welcoming tides of their illicit money and wrapping it in secrecy. Clinton's basic point is still valid. Wealthy Pakistanis are as enthusiastic about tax havens as elites in any other poor country, and their ability to escape from any responsibility to their societies while leaving everyone else to pick up the tab is one of the great factors corrupting the state and undermining its citizens' confidence in their rulers. This is a security issue as much as anything else.

Even this is not all. The global offshore system was one of the central factors that helped generate the latest financial and economic crisis since 2007. Offshore did not exactly cause the financial crisis: It created the enabling environment for the conditions underlying the crisis to develop. "Trying to understand the role that offshore secrecy and regulatory havens have in the crisis," Jack Blum explains, "is like the problem a doctor has treating a metabolic disease with multiple symptoms. You can treat several symptoms and still not cure the disease. Diabetes, for instance, causes high cholesterol, high blood pressure, and all sorts of other problems. There are plenty of discrete aspects of the meltdown to talk about and many possible treatments for symptoms, but offshore is at the heart of this metabolic disorder. Its roots reach back decades, in bankers' attempts to escape regulation and taxation and make banking a highly profitable growth business that mimics the industrial economy."[49]

I will explore this in more detail later—but here is a very short summary of some basic reasons why offshore is implicit in the latest economic crisis.

President Roosevelt's New Deal in the 1930s inflicted a lasting defeat on financial capital, blaming it for the horrors of the Great Depression and tying it down with constraints that would ensure that the financial services sector would contribute to economic development, not undermine it. The New Deal was a great success, but it began to unravel properly just before the
1960s, when Wall Street found its offshore escape route from taxes and domestic regulations: first in London (the subject of chapter 4) then further afield in the British spiderweb and beyond. The offshore system provided Wall Street with a "get out of regulation free" card that enabled it to rebuild its powers overseas and then, as the United States turned itself in stages into a tax haven in its own right, at home. The end result was that the biggest banks were able to grow large enough to attain "too big to fail" status—which helped them in turn to become increasingly

influential in the bastions of political power in Washington, eventually getting a grip on both main political parties, Democrat and Republican—a grip that is so strong that it amounts to political capture.

Part of this process has involved a constant race to the bottom between jurisdictions. When a tax haven degrades its taxes

or financial regulations or deepens its secrecy facilities to attract hot money from elsewhere, other havens degrade theirs too, to stay in the race. Meanwhile, financiers threaten politicians in the United States and other large economies with the offshore club—"don't tax or regulate us too heavily or we'll leave," they cry—and the onshore politicians quail and relax their own laws and regulations. As this has happened, onshore has increasingly taken on the characteristics of offshore. In the large economies, tax burdens are being shifted away from mobile capital and corporations onto the shoulders of ordinary folks. U.S. corporations paid about two-fifths of all U.S. income taxes in the 1950s; that share has fallen to a fifth.[50] The top 0.1 percent of U.S. taxpayers saw their effective tax rate fall from 60 percent in 1960 to 33 percent in 2007, while their share of the income pie soared.[51] Had the top thousandth paid the 1960 rate, the federal government would have received over $281 billion more in 2007.[52] When the billionaire Warren Buffett surveyed members of his office he found that he was paying the lowest tax rate among his office staff, including his receptionist. Overall, taxes have not generally declined. What has happened is that the rich have been paying less, and everyone else has been forced to take up the slack. The secrecy jurisdictions, in partnership with changing ideologies, are the biggest culprits.

The next factor behind the latest economic crisis is the huge illicit cross-border flows of money that have on a net basis flowed very significantly into deficit countries like the United States and Britain, adding very substantially to the more visible macroeconomic imbalances that fostered the crisis. Meanwhile, zero-tax offshore incentives helped encourage companies to borrow far too much, injecting more risk and leverage into the financial system. In addition, financial and other firms have been festooning their financial affairs around the world's tax havens for reasons of tax, regulation, or secrecy—and the resulting complexity, mixed with offshore secrecy, made their financial affairs impenetrable to regulators and investors alike, eventually feeding the mutual mistrust between market players that helped trigger the crisis.

And now, to cap it all, the system is providing our richest citizens and corporations with escape routes from tax and regulation, meaning that it is ordinary people who will have to pay the costs to clean up this giant mess. The harm that stems from all this is incalculable.

Yet this is not a book about the financial crisis. It is about something older and deeper.

Deregulation, freer flows of capital, and lower taxes since the 1970s—most people think that these globalizing changes have resulted primarily from grand ideological shifts and deliberate policy choices ushered in by such leaders as Margaret Thatcher and Ronald Reagan. Ideology and leaders matter, but few have noticed this other thing: the role of the secrecy jurisdictions in all of this—the silent warriors of globalization that have been acting as berserkers in the global economy, forcing other nations to engage in the competitive race to the bottom, and in the process cutting swaths through the tax systems and regulations of nation states, rich and poor, whether they like it or not. The secrecy jurisdictions have been the heart of the globalization project from the beginning.

Finally, a word about culture and attitudes. In January 2008 the accountancy giant KPMG ranked Cyprus at the very top of a league table of European jurisdictions, according to the "attractiveness" of their corporate tax regimes.[53] Yet Cyprus, a "way station for international scoundrels," as one offshore promoter admits, is among the world's murkiest tax havens: possibly the biggest conduit for criminal money out of the former Soviet Union and the Middle East into the international financial system. If Cyprus is ranked as the "best" in an international league table on tax, something is clearly wrong with the world. When transparency rankings list Switzerland and Singapore, two great sinks for illicit loot, as among the world's "cleanest" jurisdictions, then we seem to have lost our way.

Tax is the missing element in the corporate social responsibility debate. Modern company directors face a dilemma. To whom are they answerable—to shareholders only or to a wider set of stakeholders? There are no useful guidelines.[54]

Irresponsible players treat tax as a cost to be minimized, to boost short-term shareholder value alone. Ethical directors recognize that tax is not a cost of production but a distribution out of profits to stakeholders, ranking on the profit and loss account alongside dividends. It is a distribution to society, and it pays for the things like roads and education that help the corporations make their profits.

The corporate world has lost its way, and nowhere is this more true than with the Big Four accountancy firms. Paul Hogan, the star of the

film Crocodile Dundee, put his finger on something important in 2010 when talking about an investigation by Australian tax authorities into his offshore tax affairs. “I haven’t done my own tax for thirty years,” he said. “They talk about me going to jail. Erm, excuse me: There’s about four law firms and about five accounting firms—some of the biggest ones in the world—that’d have to go to jail before you get to me.”[55] On this point, Hogan is right—or at least he should be. These firms, responding to their clients’ wishes to escape taxes and other duties that come with living in democratic nations, have grown to become steeped in an inverted morality that holds tax, democracy, and society to be bad and tax havens, tax dodging, and secrecy to be good. Serial tax avoiders are made knights of the realm in Britain and promoted to the top of high society in the United States; journalists seeking guidance in this complex terrain routinely turn to these very same offshore cheerleaders, the accountancy firms, for their opinions. Bit by bit, offshore’s inverted morality becomes accepted into our societies.

The fight against the offshore system will differ from other campaigns to fix the global economy. Like the fight against corruption, this struggle does not fit neatly into the old political categories of left and right. It does not involve rejecting cross- border trade or seeking solace in purely local solutions. This fight needs an international perspective, where countries try not to engage in economic warfare against each other. And it will provide a rubric for taxpaying citizens in both rich countries and poor to fight for a common cause. Wherever you live, whoever you are, or what you think, this affects you.

Millions of people around the world have for years had a queasy feeling that something is rotten in the global economy, though many have struggled to work out what the problem is. This book will point to the original source of where it all went wrong.

TECHNICALLY ABROAD
The Vestey Brothers, the American Beef Trust, and the Rise of Multinational Corporations

ONE WINTER IN 1934 THE ARGENTINE COAST GUARD detained a British-owned ship, the Norman Star, as it was about to sail for London. The raid had been triggered by an anonymous tip-off during an investigation into a cartel of foreign meat packers who were suspected of manipulating prices and shipping profits illegally overseas.

Ordinary Argentinians, amid the Great Depression, were furious about just about everything at that time. Their economy was still mostly in the hands of a few hundred landowning families, and British and American meatpacking houses, which engaged their employees under humiliating conditions, had organized a cartel so effective that while the prices they paid locals for their beef had plummeted, the investors' profits actually rose. The beef export industry was a major plank in the growth of the political power of the Argentine elites; in his book The Rise and Fall of the House of Vestey, the biographer Philip Knightley argues that the meat packers' cartel had such a crippling effect on the Argentine labor movement and early economic development that "it led almost directly to the formation of militant labour organisations that pushed Peron into power, the subsequent dictatorship of the generals, the terrorism, the Falklands War and the country's economic disasters."[1]

How much profit were these foreigners really making? Nobody could be sure, but London's influence on the Argentine economy was immense. "Without saying so in as many words, which would be tactless, Argentina must be regarded as an essential part of the British Empire," the British ambassador had noted in 1929. But he was not complacent, for he was aware how fast large U.S. companies were penetrating these areas of British influence. "The United States under Hoover means to dominate this continent by hook or by crook," the ambassador had recently noted. "It is British interests that chiefly stand in the way. These are to be bought out or kicked out."[2] The big historical competitors of the British meat packers, though now inside the Argentine

cartel, were the Swift and Armour groups from Chicago that until recently had formed the core of the American Beef Trust, an organization founded by the robber baron Philip D. Armour. The trust had sewn up food distribution inside the United States so effectively that a book about it published in New York in 1905, entitled The Greatest Trust in the World, described it as "a greater power than in the history of men has been exercised by king, emperor or irresponsible oligarchy . . . here is something compared with which the Standard Oil Company is puerile."[3] Although by the time of the coast guard raid their cartel tactics had been tamed in the United States, the trust was still happily playing the cartel game in Argentina, in partnership with the British.

Argentinians, of course, hated having their economy carved up in informal economic empires run by foreigners. "Argentina cannot be described as an English dominion," said Lisandro de la Torre, the fire-breathing Argentinian senator who led the investigation into the foreign meat packers, "because England never imposed such humiliating conditions on its colonies."[4]

So he was especially pleased with what the coast guard found in the ship's holds, buried beneath a reeking load of guano fertilizer: over 20 crates labeled "corned beef" and bearing the seal of Argentina's Ministry of Agriculture. When his men opened them, they found not corned beef but documents. De la Torre had exposed to public view for the first time the secret financial details of William and Edmund Vestey, founders of the world's biggest meat retailers, Britain's richest family, and among the biggest individual tax avoiders in history. Their story, and their wrangles and deals with their American competitors, provides a remarkable wind down into the emergence of multinational corporations in the early years of the last century and the emergence of a global industry of international tax avoidance alongside them.

William and Edmund Vestey had started out in 1897 shipping meat trimmings from Chicago to their native Liverpool, where they had built cold storage facilities, giving them an edge over their competitors. They branched out into poultry farming in Russia and China in the first decade of the twentieth century, from where they began processing and shipping vast quantities of super-cheap eggs to Europe. They set up more cold stores and retail outlets in Britain, and then in France, Russia, the United States, and South Africa, then moved into shipping in 1911, before expanding out to ranches and meatpacking in Argentina from 1913. At the outbreak of the First World War, they bought up more

farmland and plants in Venezuela, Australia, and Brazil,[5] by which time they were involved in the entire supply change of the beef trade, from cattle to restaurant hamburger. They were pioneers of the truly integrated multinational corporation.

The Vestey brothers dressed in dark, sober suits and hats, and perhaps the biggest visible extravagance for each of them was a watch and chain. They had no outside interests beyond business: They did not smoke, drink, or play cards, and despite their fabulous wealth they lived in modest houses and ate cheap meals. Once, while on honeymoon in Ceylon, William heard of a fire at a company packing plant in Brazil and packed his new wife off to sort out the mess there. William returned to London on the next steamer.[6] Frugal and puritan, the brothers refused to trade alcohol and would even inspect their employees' fingers for tobacco stains.

They lived by the maxim that it is not what you can earn that makes you rich but what you can keep. They lived on the interest on the interest on their income. Peers of the Realm, Masters of the Foxhounds, personal friends of the Prince of Wales, and that sort of thing, the extended Vestey family still enjoys so much inherited money today that some have only discovered they are heirs when presented, on their eighteenth birthday, with checks for startling amounts. One distant heir, suddenly presented with a quarter of a million pounds in the 1990s, said, "I can't handle it" and turned it down.

The brothers lived by two business rules above all: first, never reveal what you are up to; and second, never let other people do something for you if you can do it yourself. They were, at heart, monopolists. They gave their different companies different names to disguise their ownership and bought up rivals, and if one resisted they would use their extraordinary market power— derived from their owning the whole supply chain from the grass, via the cows, to the slaughtering houses, the freezers, the ships, and then distribution and retail outlets—to drive them out of business. "If you mention his name near a meat market, people look over their shoulders," wrote one critic. A weaker competitor said bitterly: "We're not doing business with them. They're in everybody's business and they want everybody's business."

As their business grew increasingly multinational, it became ever harder for anyone to even guess what they were up to. "The juggling acts El Inglés [the Vestey company] performed with the packing houses were enough to give the best aviator a dizzy spell," an Argentinian businessman wrote. "It is not surprising that the company tax inspector had a difficult job to unravel it all when El Inglés, in the end, was left with just one packing house."[7] In partnership with the Americans, the brothers showed the same controlling behavior at the retail ends too.

So when Senator de la Torre's investigation stumbled across the documents on the Norman Star he had achieved quite a coup. Top members of the Argentinian government were colluding in, and even profiting from, their subterfuges, he alleged, and dirty political brawls broke out. Insults and counter-insults ricocheted around the Argentine political landscape, culminating in an assassination attempt on de la Torre in which an aide died after taking a bullet intended for the senator.[8]

The Vesteys' basic formula for gaining market power—squeeze them at the producer end, squeeze them at the consumer end, and push all the profits into the middle—was a philosophy that they also deployed, with astonishing success, in the area of tax. It is a formula that underlies the size and power of multinational corporations today.

In those early days the tax haven world was in its infancy, and governments were groping in the dark to understand and to tax emerging multinational corporations. (They still are.) Relatively few tax havens existed then, focusing mostly on the financial affairs of extremely wealthy individuals. Rich Europeans looked primarily to Switzerland, while wealthy Britons tended to use the nearby Channel Islands and the Isle of Man. Wealthy Americans were busy too, as a letter from U.S. Treasury Secretary Henry Morgenthau to FDR in 1937 suggests.[9] "Dear Mr. President," it begins. "This preliminary report discloses conditions so serious that immediate action is called for." American tax evaders had set up foreign personal holding corporations in places with low taxes and lax corporation laws, he wrote, singling out the Bahamas, Panama, and Newfoundland, Britain's oldest colony. Stockholders were organizing companies through foreign lawyers, with dummy incorporators and dummy directors, to hide their identities. Though extremely rudimentary by modern standards, the basic schemes Morgenthau

outlined would be familiar to followers of today's offshore shenanigans. "The ordinary salaried man and the small merchant does not resort to these or similar devices. Legalized avoidance or evasion by the so-called leaders of the business community . . . throws an additional burden upon other members of the community who are less able to bear it, and who are already cheerfully bearing their fair share."

On the corporate side, offshore activity did not initially focus so much on tax. One great historical landmark in this respect emerged in the late nineteenth century when James B. Dill, a New York corporate lawyer, persuaded the governor of New Jersey that the state could get out-of-state corporate managements to incorporate there by passing permissive incorporation laws favorable to managers to the detriment of shareholders. New Jersey passed its first such law in 1889, then relaxed its rules again and again.[10] Corporations, including the Standard Oil Trust, began to relocate out of New York and other large centers and flock to New Jersey. Britain and the Netherlands began to follow the U.S. lead.[11]

Just before the First World War, however, New Jersey's governor Woodrow Wilson decided to check the rampant corporate abuses that had emerged as a result of these permissive incorporation laws and put in place progressive new antitrust laws and rules to make corporate managers more accountable to shareholders, investors, and other stakeholders. So corporations flocked to neighboring Delaware, which had already set the standard to be used by tax havens thereafter, by letting corporate managers effectively write their own corporate governance rules. By 1929 two-fifths of Delaware's income came from corporate fees and taxes, and it led the United States in incorporations, a lead it has never lost. An article in the American Law Reviewin 1899 noted Delaware's efforts to win the race to relax corporate standards and called Delaware "a little community of truck-farmers and clam-diggers . . . determined to get her little, tiny, sweet, round, baby hand into the grab-bag of sweet things before it is too late."

This brief digression into corporate law helps remind us what offshore is all about. It is not just about tax: In this case it is about attracting money by offering rewards to insiders, at the expense of other stakeholders, undermining or undercutting the rules and legislation of other jurisdictions.

And indeed, Delaware seems to have a long historical predilection toward offshore business: At the Constitutional Convention, Delaware's delegation fought aggressively for each state to get the

right to send two senators to Congress— putting tiny Delaware on a par with mighty New York. A Delaware delegate [12] threatened that if they didn't get their way, "the small ones would find some foreign ally of more honor and good faith, who will take them by the hand and do them justice." It is easy to see, in light of examples like this, why offshore business is so often described as unpatriotic.

Offshore corporate tax avoidance really started taking off around the time of the First World War: Before that, taxes were mostly too low to worry about.[13] When war broke out, however, a lot of countries needed to raise a lot of money fast, and income taxes rose dramatically. In the United States, the top rate of tax for individuals rose from 15 percent in 1916 to 77 percent in 1918. The nation introduced the corporate income tax only after the Sixteenth Amendment was ratified in 1913, and it rose to 12 percent in 1918, by which time corporation taxes amounted to half of all federal tax revenues. In Britain the standard rate rose fivefold during the war to 30 percent in 1919, the year after the war ended. But in 1914 Britain had done something else that was especially pertinent for the Vesteys: It had begun to tax British companies on all their income worldwide, whether or not they brought this income home.[14] And the Vesteys were furious.

They tried lobbying against being taxed—which, in the new wartime environment, was doomed to look unpatriotic and to fail. As Britain's tax authorities noted, taxes on business profits never stop you from earning the profits—they only kick in once there are profits.

But William and Edmund Vestey were having none of it. In November 1915, as fifty thousand British soldiers died at the Battle of Loos, the brothers moved overseas to cut their tax bill. Their first stop after leaving was Chicago, where they found they weren't the first wealthy Britons to move for tax reasons. "What's the matter with your people?" a local tax lawyer asked. "You are the third Englishman I've had in here this week in the same business." From there they moved to Argentina, where they paid no income tax at all—and even then, they fought to cut the residual company taxes they still had to pay in Britain.

As the war progressed, however, the brothers increasingly started to wish they could return home, closer to their food empire's real profit center. So they began to hatch up a new scheme to return and still escape the tax net.

They put into place a two-stage plan. First they returned temporarily in February 1919, taking careful legal precautions to ensure they continued to be treated as visitors, not taxable residents, and they began

lobbying. They wrote an impassioned plea to the prime minister, dressed up with appeals to patriotism and claiming their return would contribute to local employment

—arguments that multinational corporations still routinely make today. They also complained bitterly about how unfair it was that their big competitor, the American Beef Trust, faced lower taxes and gained a big competitive advantage from it.

They had pointed to one of the great problems in international tax. Each country taxes its citizens, residents, and corporations in different ways, and different countries' tax systems often clash in unpredictable ways. Multinationals based in these different countries face very different tax bills on similar incomes, enabling one to out-compete another on a factor that has nothing to do with efficient management or real productivity.

U.S. citizens and corporations formed under U.S. laws were taxed on their income from all sources worldwide, and the test of whether one was a U.S. taxpayer was based on citizenship, not on residence—a subtle but important difference. But if the corporation—even a subsidiary of a U.S.-based corporation—was formed overseas, it did not pay taxes to the United States but to the foreign country where it was incorporated. The Chicago-based Beef Trust used this to avoid paying taxes in the United States—and then used various loopholes to avoid tax in Britain, too, where it sold a lot of its meat.

The Vesteys, who were paying significant taxes, did not like it, and the British prime minster referred their claims to an official commission. William's testimony to that commission was to become a classic in the tax world, cited in academic tax papers ever since. He posed the question of double taxation that I referred to in chapter 1: When a business is spread across several countries, which country gets to tax which bit of it?

"In a business of this nature you cannot say how much is made in one country and how much is made in another," said William Vestey. "You kill an animal and the product of that animal is sold in fifty different countries. You cannot say how much is made in England and how much abroad." He had put his finger on the central problem with taxing multinational corporations today. By their nature they are integrated global businesses, but tax is national. Taxing a corporation straddling multiple jurisdictions involves gruesome complications, and if each country scrambles to get as large a share as possible of the multinational's taxes, then the corporation risks being taxed twice or more on the same income.

So as taxes rose across the wealthy nations amid the First World War, a new source of economic conflict emerged. Double taxation became a

hot issue, and businesses began to complain and to mobilize. An International Chamber of Commerce was set up in 1920, with tax squarely on its agenda from the outset.[15]

From the beginning, the emerging multinationals stayed a few jumps ahead of tax collectors.

Just as the Vesteys and the U.S. meat packers used their market muscle to squeeze their competitors at both the producer end and the consumer end, so they also began to squeeze the tax authorities at both ends. The trick, once again, was the same "transfer pricing" principle used by the banana companies that I described in the last chapter. If you own the ranches, the cattle, the freezers, the docks, the ships, the insurers, the wholesalers, and the retailers, then you can, by adjusting the prices one subsidiary charges another for goods, drive the profits away from the producer and the consumer countries, and instead take your profits at the most convenient place down the line. "And the most convenient stage," notes Knightley, "is naturally where you will pay the least taxation, preferably where you will pay none at all."

By siphoning the profits to a holding company in a tax haven, explains tax expert Sol Picciotto, the multinationals had found a way to avoid being taxed anywhere. They could now out-compete, and grow faster than, smaller, purely national firms. A system designed to avoid double taxation had, via the use of tax havens, turned into one of double nontaxation. And through this basic formula, the offshore system has become one of the main foundations of the power of multinational corporations today.

William Vestey's testimony to the official commission in 1920 reveals a man accustomed to getting his way. "If I kill a beast in the Argentine and sell the product of that beast in Spain, this country can get no tax on that business," he said. "You may do what you like, but you cannot have it."[16] He wanted to live in Britain, without paying his way, demonstrating an arrogance that pervades the offshore system, underpinned by that same old argument that bankers and other owners of footloose capital wield against our democratic representatives today: don't tax or regulate us too much, or we will move offshore.

Stung by the Vesteys' lack of patriotism after a major war, the commissioners hit back. "Are you not to pay anything for the advantage of living here?" one asked. William Vestey refused to answer. "I should

like to have an answer," the commissioner continued. "It is one that has agitated me a good deal since the witness has been in the chair." In the end, Britain refused to give in to the Vesteys. So they moved to the second stage of their plan, involving a more devious approach, something that helps us better understand the slippery world of offshore.

They set up a trust.

Many people think that the best way to achieve secrecy in your financial affairs is to shift your money to a country like Switzerland, with strong bank secrecy laws. But trusts are, in a sense, the Anglo-Saxon equivalent. They create forms of secrecy that can be harder to penetrate than the straightforward reticence of the Swiss variety. Trusts are powerful mechanisms, usually with no evidence of their existence on public record anywhere. They are secrets between lawyers and their clients.

Trusts emerged in the Middle Ages when knights leaving on the Crusades would leave their possessions in the hands of trusted stewards, who would look after them to provide benefits to the knights' wives and children when they were away or if they never returned. These were three-way arrangements binding together the original owners of the properties (the knights), with the beneficiaries (their families), via an intermediary (the stewards, or trustees). Over the centuries bodies of law grew up to formalize these three-way arrangements, and today you can enforce these things in the courts.

What a trust does, at heart, is to manipulate the ownership of an asset. You might think ownership is a simple thing: you have, say, a million dollars in the bank; you own it, and you can save it, or spend it, or take it out in ten-dollar bills and put it in your bathtub. But ownership can, in fact, be unbundled into separate strands. This happens, for example, when you buy a house with a mortgage: Until you repay the loan, the bank has some ownership rights over your house and you have other rights.

A trust unbundles ownership into different parts very carefully. When a trust is set up the original owner of an asset in theory gives it away into a trust. The trustee becomes the legal owner of the asset—though this person is not free to spend or consume it—for they must legally obey the terms of the trust deed, the instructions that tell them exactly how to share out the benefits to the beneficiaries. The trustee must obey these instructions, and apart from fees he or she may not receive any of the benefits. So a rich old man with two children might put $5 million into a bank account owned by a trust, then appoint a reputable lawyer as the

trustee, instructing him that when the son is twenty-one he should receive half the money, and when the daughter later becomes twenty-one she should get the rest. Even if the wealthy man dies before the money is paid out the trust will survive, and the trustee is bound in law to pay out the money as he is told. It is very hard indeed to break a trust.

Trusts can be legitimate. But they can be used for more nefarious purposes, like criminal tax evasion. When a trust sets up solid legal barriers separating out the different components of ownership of an asset, these barriers can become unbreakable information barriers too, shrouding the assets in secrecy.

Imagine that the assets in a trust are shares in a company. The company may register the trustee—the legal owner—but it will not register the beneficiaries—the people who will be getting and enjoying the money—anywhere. If you have a million dollars in an offshore trust in the Bahamas and the tax inspectors come after you, it will be hard for them to even start their inquiries: Trust instruments in the Bahamas are in no official register. Even if the tax inspectors or police get lucky and find out the identity of a trustee, that is likely to be simply a Bahamas lawyer who does this for a living, who may be the trustee for thousands of trusts. She may be the only other person in the world who knows you are the beneficiary, and he or she is bound by professional confidentiality to keep your secrets safe. The tax inspector has hit a stone wall.

You can make this secrecy deeper still, of course, by layering one secrecy structure on another. The assets in the Jersey trust may be a million dollars in a bank in Panama, itself protected by strong bank secrecy. Even under torture the Bahamas lawyer could never reveal the beneficiary because he or she wouldn't know.[17] Such intermediaries merely send the checks to another lawyer somewhere else, who also isn't the beneficiary. You can keep on going: layering the Jersey trust on another trust in the Caymans, itself perched on a secret company structure in Nevada. If Interpol comes looking they must go through difficult, slow, and costly court procedures, in country after country, and face the "flee clauses" that mean the asset automatically hops elsewhere at the first sign of investigation.

The trust arrangement that the Vesteys set up in December 1921, signed in the Paris offices of the British lawyers Hall & Stirling, was fairly simple compared to the great offshore embroideries that are common today. Yet even so, it took Britain's Inland Revenue eight years to know it even existed.

In the meantime, while the Vesteys' secret Paris trust ticked over quietly, a new scandal erupted.

In June 1922, seven years after leaving the country to escape British wartime taxes, it emerged that William Vestey had bought himself a title, becoming Baron Vestey of Kingswood. Plenty of people who had

made fortunes in the Great War had done this, craving the respectability of a peerage to mask the taint of war profiteering. Prime Minister Lloyd George had sold off official honors willy-nilly, causing outrage. "Gentlemen received titles," a member of parliament had spluttered in 1919, "whom no decent man would allow in his home." When challenged on his tax-avoiding activities, William Vestey did not endear himself to anyone by stating that "I am technically abroad at present . . . the present position of affairs suits me admirably. I am abroad. I pay nothing." The scandal rumbled on, but in the end nothing was done and the Vesteys returned home to Britain as they had wished. Their secret Paris trust kept the tax authorities at bay.

But even when the British tax authorities found the Paris trust, through patient detective work, they still could not get the Vesteys to pay tax on it. For secrecy is not the only subterfuge that trusts provide.

People are sometimes puzzled by one particular thing about trusts. If you must give the asset away into a trust in order to hide the asset and dodge your tax bill, is that not an oversize price to pay?

The answer is not straightforward. In part, this is a cultural question. Wealthy classes have grown to feel comfortable separating themselves from their money and leaving it to be managed by trusted strangers. Their education prepares them to recognize those who will respect their claims and whom they can therefore count on to do the right thing by them.

But there is another part to the answer, which offers further insight into the sneaky world of offshore. If you want to evade taxes or hide money through a trust, the trick is to make it seem as if you have given your asset away, while in reality you retain control of it. You can tell the tax authorities, or the police, that you really don't own the asset anymore—and only your trust lawyer need know that you are still really in control.[18] The preamble to the Paris trust deed hints at exactly that pretence. "In consideration of the natural love and affection of the settlors [the Vesteys] for the beneficiaries," it began, "and for divers other good causes and considerations." The money, it was saying, had really been given away to their dear beneficiaries, their wives and children.[19]

But what the Vesteys actually did was this. First, they leased most of their overseas empire to Union Cold Storage Ltd., a company based in Britain. In any normal arrangement, Union would have simply paid rent to the Vestey brothers. But instead Union paid the rent to two trusted lawyers and a company director in Paris. These trustees were then given

very wide powers of investment, to be carried out under the direction of certain "authorised persons." And who were those persons? Why, the Vestey brothers! So the trustees, under the Vesteys' direction, lent large sums to another company in Britain, which the Vesteys also controlled, and which they used as their own personal piggy bank.[20] They had seemed to have given away their money while retaining real control.

And here comes a point about tax havens. Reputable jurisdictions have put in place laws to make it very hard for you to play this trust subterfuge. But secrecy jurisdictions have done the opposite, specializing in providing laws to help you perfect the deceit. Many jurisdictions, for example, allows things called revocable trusts—trusts that can be revoked so that the money is returned to the original owner. If you can do that, then you have not really separated yourself from the asset. Until it is revoked, though, it looks as though you have passed the asset on, and the tax authorities cannot have it. A Jersey sham trust provides a different subterfuge, letting you replace trustees with more pliable ones later, and changing their instructions at will. Or a trust might have a "trust protector" who has influence over the trustees, who acts discreetly on behalf of the person who pretended to give the money away. A Cayman Islands "Star Trust" lets you, the original owner, make the trust's investment decisions—and the trustee is not obliged to ensure the investments are in the interests of other beneficiaries. And so it goes on. There are offshore lawyers who sit in their offices all day, doing little more than dreaming up deviant new flavors of trusts.

Trusts are not only about tax, either. As we shall see, many of the structured investment vehicles that helped trigger the latest economic crisis involved offshore trusts. Most people would be surprised, even shocked, to find out how central they are to global finance.

In choosing the trust mechanism to protect their vast wealth, the Vesteys had chosen a powerful weapon indeed. And when the Argentinian senator Lisandro de la Torre found those crates of Vestey documents buried under the guano on the Norman Star in 1934, he was probably unaware just how crafty his adversaries were in this kind of offshore subterfuge. Soon after the raid, new and incriminating Vestey documents turned up in Uruguay, and the senator achieved another coup when he got the British Foreign Office, whose diplomats were deeply uneasy with the Vesteys' business practices, to agree to turn Argentina's quest into a

multicountry joint committee of investigation.

There was no telling what such a probe might uncover, so the Vesteys went on the offensive. When their local manager died of a heart attack, William Vestey wrote to the committee and brazenly accused Senator de la Torre of murdering him. Argentina's government responded furiously, calling Vestey's letter "an unprecedented piece of insolence."

Things went downhill from there. The committee worked for two more years while the Vesteys pulled strings in London to emasculate it, and despite sixty meetings and a report filled with detail about the Argentine meat trade, they never got to see the Vestey books in London. Senator de la Torre shot himself on January 5, 1939, leaving a suicide note that, as his biographer Philip Knightley notes, "expressed his disappointment at the general behaviour of mankind."

Each time Britain's authorities tried to tax overseas trusts in the ensuing decades, William and Edward, and their descendents, kept refining their tax planning and slipping through the net. "Trying to come to grips with the Vesteys over tax," one tax officer said, "is like trying to squeeze a rice pudding."

In 1980, shortly after one such assault by the Inland Revenue, an investigation by the Sunday Times, then one of the world's most respected newspapers, revealed that in 1978, the Vesteys' Dewhurst chain of butchers in Britain had paid just £10 tax on a profit of more than £2.3m—a tax rate of 0.0004 percent. "Here is an immensely wealthy dynasty which for more than sixty years has paid trivial sums in tax," the newspaper wrote. "All that time its members have enjoyed the considerable pleasures of being rich in England without contributing anything near their fair share to the defences which kept those pleasures in being— against foreign enemies in wartime, against disorder and disease in times of peace." Edmund Vestey, the grandson of the original Edmund, put the icing on this particular cake. "Let's face it, nobody pays more tax than they have to. We're all tax dodgers, aren't we?"[21]

The Paris trust loophole was finally closed in 1991,[22] but opportunities for legal tax avoidance for Britain's wealthy remain abundant. When the British Queen finally started paying income tax in 1993 after a public outcry, the latest Lord Vestey smiled and said: "Well, that makes me the last one."

As we shall soon see, he was very far from alone.

THE OPPOSITE OF OFFSHORE
John Maynard Keynes and the Struggle against Financial Capital

IT IS WITH A STRANGELY DEFENSIVE TONE that Robert Skidelsky, the best-known biographer of John Maynard Keynes, prefaces the U.S. edition of volume 3 of his biography of the great British economist. He takes issue with U.S. economist Bradford DeLong's accusation that he has fallen under the influence of "a strange and sinister sect of British imperial conservatives."[1]

Skidelsky's work argues that for Britain the Second World War was in fact two wars, one pitting Britain under Winston Churchill against Nazi Germany, the other lying behind the facade of the Western alliance and pitting the British empire, led by Keynes, against the United States. America's main war aim after the defeat of the Axis powers, he argued, was to destroy the British empire. "Churchill fought to preserve Britain and its empire against Nazi Germany; Keynes fought to preserve Britain as a Great Power against the United States. The war against Germany was won; but in its effort to win it, Britain spent its resources so heavily that it was destined to lose both its Empire and its Great Power status."[2] Keynes himself outlined one of his central aims as he negotiated in Washington: "America must not be allowed to pick out the eyes of the British Empire."[3]

The arguments are complex, not least because Keynes's main negotiating partner in Washington, Harry Dexter White, was almost certainly passing information to the Soviet Union. But Skidelsky's account leaves no doubt that the two countries were quietly locked in a titanic struggle for financial dominance, as the thrusting new American superpower began to displace the old empire.

It was only long after the war that the two economic competitors would eventually work out a suitable arrangement for coexistence. It

happened, as I shall explain later, through the construction of the modern offshore system. This chapter, however, explores what came before it: an international arrangement that Keynes helped design, where nation-states cooperated with each other and tightly controlled flows of financial capital between them. This system was, in a sense, the very opposite of today's fragmented, laissez-faire system, where wild, unregulated, and untaxed tides of capital flow across borders with almost no restraint, much of it through offshore centers.

For all its problems, the years of the anti-offshore system that followed the Second World War were a period of tremendous, broad-based growth and prosperity—not just for the American middle classes but for the world as a whole. The collapse of the system in the 1970s and the explosion of global offshore finance after that ushered in a period of lower growth, recurring economic crisis, and stagnation for most Americans, while wealth at the top of the income pile soared.

Keynes was as complex a character as any who have taken the world stage. He crammed the intelligence, and seemingly the lives, of twenty people into one. The aging Alfred Marshall, arguably the leading economist of his generation, once declared after reading a pamphlet from the young economist that "verily, we old men will have to hang ourselves, if young people can cut their way so straight and with such apparent ease through such great difficulties."

Keynes first properly made his reputation in 1919 with his pamphlet The Economic Consequences of the Peace, arguing that the vast reparations being heaped on Germany after the First World War would ruin it, with terrible results for the wider world. He was quite right: The stringent demands for reparation helped trigger the rise of Adolf Hitler and the Second World War. Years later, while writing his General Theory of Employment, Interest and Money, arguably the most famous economics textbook of the last century, Keynes was building a theater in Cambridge with his own money, drawing graphs of receipts from the theater restaurant, collecting tickets when the clerk failed to materialize, and, improbably, turning it into a huge artistic and commercial success. He became a respected art critic, a towering civil servant and diplomat, a hyperactive editor of economic publications, and a journalist whose articles could make whole currencies swoon. He wrote a book on mathematical probability that the polymath and philosopher Bertrand

Russell said was “impossible to praise too highly,” adding that Keynes’s intellect was “the sharpest and clearest that I have ever known.” Russell felt that when he argued with Keynes, he “took his life into his hands.”

Opponents of Barack Obama have claimed that his Keynesian attempts to resuscitate the U.S. economy through deficit- financed public works constitute a Soviet-styled takeover of the free enterprise system. Yet Keynes was never the socialist bogeyman of the conservative imagination. He loathed Marx and Engels, he saw government intervention as a temporary fix, and he believed passionately in markets and trade as the best routes to prosperity. He wanted to save capitalism, not bury it.

For much of the nineteenth century, free traders had dominated policy in the United States and much of Europe: It was self- evident, many people thought, that free trade delivered prosperity and brought peace by creating economic interdependencies that made it harder to wage war. It was a bit like an argument memorably made in the 1990s by journalist Thomas Friedman, who said that no two countries with a McDonald’s—that symbol of free trade and the “Washington Consensus”—had ever fought a war with each other.[4] Keynes believed this, for a while. “I was brought up, like most Englishmen, to respect free trade,” he wrote in the Yale Review in 1933, “almost as a part of the moral law. I regarded ordinary departures from it as being at the same time an imbecility and an outrage.”[5]

He had begun to see then that finance is different. He learned of the irrationality of markets first hand, spending half an hour each day in bed speculating with his own money in the famously treacherous terrain of international currencies and commodities, diving into company balance sheets and statistics (and declaring of the latter discipline that “nothing except copulation is so enthralling”).[6] It made him a fortune, though he nearly bankrupted himself when a gamble against the Deutschmark in 1920 went disastrously wrong. “When the capital development of a country becomes a by-product of the

activities of a casino," he famously said,
"the job is likely to be ill-done."

Keynes understood instinctively the important differences between trade and finance. When two parties trade goods with each other, it is more or less a meeting of equals. But with finance the borrower is usually subservient to the lender. It is a relationship described years later by James Carville, Bill Clinton's adviser, who famously articulated the borrower's sense of helplessness when he said that if reincarnated he wanted to come back as the bond market because then "you can intimidate everybody." The interests of industrial capitalists and financial capitalists often conflict too. Financiers, for instance, tend to like high interest rates, from which they can derive considerable income, while industrialists want low interest rates, to curb their costs.

And the financiers then, as today, firmly had the upper hand. As is well known, the Great Depression that erupted in 1929 was the culmination of a long period of deregulation and economic freedom for Wall Street and a great bull market built on an orgy of debt, along with mind-bending rises in economic inequality. In the late throes of the boom the richest twenty-four thousand Americans, for example, received 630 times as much income on average as the poorest 6 million families[7]; and the top 1 percent of people received nearly a quarter of all the income—a proportion slightly greater than the inequalities suffered at the onset of the global crisis in 2007. "We have involved ourselves in a colossal muddle," Keynes wrote in the 1930s, "having blundered in the control of a delicate machine, the working of which we do not understand." The similarities with our current situation can hardly be missed.

Though there was no interconnected offshore system in his day—just the few assorted havens I described in the last chapter— Keynes still offered penetrating insights that help us understand the offshore system and are eerily prescient in light of the recent global financial and economic crisis.

When a company or government sells bonds or shares, investors hand over money in exchange for pieces of paper that give the holder title to a future stream of income. When the bonds or shares are first issued, savings are mobilized, funds are raised, and they flow into productive investment. This is generally healthy. But the next step is when things change. A secondary market appears in these pieces of paper, where

the shares and bonds are traded. These trades no longer contribute to creating new productive investment in the real world: They merely shuffle ownership. Well over 95 percent of purchases in global markets today consist of this kind of secondary activity, rather than real investment. Keynes explained what happens when you start to separate real business operations in the real world from their owners. The holders of paper, the investors, become detached from the real businesses that they are investing in, and incentives change dramatically. When this happens across borders, the problem gets worse still: "When the same principle is applied internationally it is, in times of stress, intolerable," Keynes continued. "I am irresponsible towards what I own, and those who operate what I own are irresponsible towards me."

Shuffling ownership of bits of paper may seem to promote efficiency by helping capital flow to those projects that offer the highest risk-weighted returns, Keynes noted. A little speculative trading in these markets may well improve information and regulate prices. But in the real world, when the volume of this dealing is a hundred times bigger than the underlying volume of real trade, the results can be catastrophic. "Experience is accumulating," he said, "that remoteness between ownership and operation is an evil in the relations among men, likely or certain in the long run to set up strains and enmities which will bring to nought the financial calculation."

His words seem more apt than ever in a world where credit derivatives, asset-backed securities, and other products of financial engineering have placed ingenious but impenetrable barriers between investors and the assets they own, becoming great financial tinsel that is repackaged and resold down chains of investors across the planet, at each step being distanced further from the people and businesses who populate the real world.

Now consider the offshore system in light of this. The secrecy jurisdictions, by applying a sort of super-lubricant to the flow of capital around the world, dramatically widen these chasms inside capitalism. They are the supreme generators of remoteness and artificiality: creating secrecy barriers and generating unfathomable complexity as corporations garland their financial affairs around the world's tax havens to fox the world's tax authorities and regulators, and to shield particular investors against other nations' laws and regulations. As we have discovered since 2007, the system was wildly inefficient: consider the wealth destroyed and the costs heaped onto the shoulders of taxpayers.

Capital no longer flows simply to where it gets the best return but to

where it can secure the best tax subsidies, the deepest secrecy, and to where it can most effectively evade the laws, rules, and regulations it does not like. None of this has anything to do with allocating capital more efficiently. Keynes would have viewed the explosion in offshore finance since the 1970s—and the massive capital flight it fostered—with horror.

With all this in mind, we can now turn to one of Keynes's great feats: the construction of a new world order after the Second World War that was the antithesis of the offshore system that would follow.

As Britain entered into the Second World War, Keynes went to Washington to negotiate the terms on which the nation was to receive U.S. assistance and to discuss what might come after the war. Many Americans, he soon realized, were rather more hostile to Britain than he had supposed. Roosevelt, for example, despised the British empire, mistrusted England's aristocracy, and, Skidelsky notes, "suspected the Foreign Office of pro-fascist tendencies."[8]

Americans had fairly effectively chained and muzzled Wall Street after the Great Depression, and policymakers in Washington saw the far more lightly regulated City of London—the financial heart of the hated British empire—with deep suspicion. Britain was discriminating against American goods in international trade, and Roosevelt's Republican opponents were horrified at the prospect of entanglement in another foreign war. Why help Britain again, many asked, after Britain had snared America into entering the First World War, then refused to pay its war debts and hung on to its empire. After the British army was forced into a humiliating retreat from Dunkirk in 1940, some in Washington were also reluctant to back what looked like a lost cause.

Global economic might had already shifted decisively across the Atlantic from London to New York, but Britain still held India by force, along with much of Africa and the Middle East. Keynes's combative and too-clever-by-half style fitted Americans' stereotypes of the British as super-wily imperial puppeteers, ready to bamboozle them. When Keynes first met U.S. Treasury Secretary Henry Morgenthau, who was no lover of technicalities, Keynes spoke for an hour, in great detail—and Morgenthau "did not understand one word," a Washington insider later wrote to a friend.[9] Harry Hopkins, one of Roosevelt's advisers, called

Keynes "one of those fellows that just knows all the answers."

But Keynes's problem was more fundamental. America wanted Britain to fight fascism, and it was prepared to give huge military aid under its Lend-Lease Act of March 1941, but it also saw the war as the chance to dethrone Britain and its empire once and for all. As Keynes wrote later, the U.S. administration took every possible precaution to see that the British were as near as possible to bankrupt before giving any help. "Why do you persecute us like this?"[10] he once asked his American counterparts. In response to the challenge, Britain's chief aim was, as Keynes put it, "the retention by us of enough assets to leave us capable of independent action."[11]

It was a grueling war for Keynes, in a decidedly unequal contest. He was seriously ill, diagnosed with septic tonsils and a "large heart and aorta," and he was representing an empire on its knees. When Keynes disagreed with his American counterpart Harry Dexter White, the American economist Brad DeLong wrote, "he usually lost the point because of the greater power of the United States. And in almost every case it seems to me that Keynes was probably right."[12]

As the war went on, Keynes turned his attention in Washington to negotiating the construction of a new cooperative international monetary order to govern future economic relations among the nations of the world, grounded upon efforts to restrain the international financial freedoms that had preceded and helped cause the Great Depression. The rampant capitalism of that era, founded upon an old alliance between Wall Street and the City of London, had involved freely floating currencies, strictly balanced government budgets, and free flows of capital around the world—a little like the modern global financial system. "The decadent international but individualistic capitalism," Keynes wrote, "is not a success. It is not intelligent, it is not beautiful, it is not just, it is not virtuous—and it doesn't deliver the goods. In short, we dislike it, and we are beginning to despise it." On this broad point his American colleagues were with him: Morgenthau said that the aim must be "to drive the usurious money-lenders from the temple of international finance."[13]

Keynes's negotiations culminated in the Bretton Woods Conference in 1944, the outcome of which would shape the international financial architecture for decades. The conference involved many nations but was an American production: The U.S. Treasury stage-managed the drafting committees and the conference to produce the desired results. U.S. Commission chairmen would prevent a vote on anything they didn't want

voted on and would arrange the discussion to stop inconvenient topics from being aired.[14] It was hard to see what the international "monkey house" of delegations from other countries would do, Keynes archly commented: "Acute alcohol poisoning would set in before the end."

Keynes had hoped that the IMF would become a depoliticized institution, overseeing automatic mechanisms to resolve global financing imbalances automatically and remove politics—and raw American power—from the equation as far as possible. He did not get his wishes, and when these matters were decided at a subsequent meeting in 1946, Keynes said acidly that he hoped "there is no malicious fairy, no Carabosse"—a reference to the wicked fairy-tale godmother figure of Sleeping Beauty, popularized in Tchaikovsky's and later Diaghilev's ballet—"whom he has overlooked and forgotten to ask to the party." Fred Vinson, a top U.S. negotiator, who felt he was the target of the remark, was heard to say in response, "I don't mind being called malicious—but I do mind being called a fairy."[15]

Many people today see the IMF and World Bank—the children of the Bretton Woods Conference—as the handmaidens of globalization, of unfettered trade and capital flows, and the instruments of Wall Street bankers. This was not the original idea. Keynes did want open trade, but finance was to remain tightly regulated: otherwise, surges of flighty capital would generate recurrent crises that would hamper growth, disrupt and discredit trade, and possibly drive fragile European economies into the arms of the communists.

Keynes understood the basic tension between democracy and free capital movements. In a world of free capital flows, if you try to lower interest rates, say, to boost struggling local industries, capital is likely to drain out overseas in search of higher returns, thwarting your original intent.[16] Investors hold a kind of veto power over national governments, and the real lives of millions of people will be determined not by their elected representatives but by what the Indian economist Prabhat Patnaik called "a bunch of speculators." Freedom for financial capital means less freedom for countries to set their own economic policies: from financial freedoms a form of bondage emerges.

Keynes's answer was simple and powerful: control and constrain the flows of capital across borders and limit the trade in currencies through exchange controls. He believed that financing was usually best when it happens inside, rather than between, countries. Capital controls would give governments more room to pursue objectives like maintaining full employment: Instead of limiting the scope of democracy in the interests

of speculators and financiers, the plan was to limit the international mobility of capital: Finance would be society's servant, not its master. "Let goods be homespun whenever it is reasonably and conveniently possible," he wrote. "Above all, let finance be primarily national." The Bretton Woods plan, for all its faults, was designed to tame the forces of international finance.[17]

Capital controls can be hard to imagine for those who have not experienced them. To get foreign exchange for overseas trips, for example, you needed official permission. Frequent international travelers, for instance, would have a section in their passports, "Foreign Exchange Facilities—Private Travel," that would be filled with official stamps and signatures authorizing access to sums of foreign exchange. Companies had to get permission to shift money across borders.

This short history helps us to see how very far indeed we have now traveled from the system created by Keynes and his American counterpart Harry Dexter White. Dismantling capital controls is one thing. But we have taken a full step again beyond that, to a world where capital is not only free to flow across borders but is actively and artificially encouraged to flow, lured by the offshore attractions of secrecy, evasion of prudential banking regulations, tax evasion and avoidance, and more. Once again, Keynes would have been horrified.

There is something else about this episode that is rather less well known.

Many mainstream economists embrace a simple idea that goes something like this. Poor countries lack capital. Foreign investment can fill the gap. So it makes sense to free up flows of capital to let capital flow into these capital-starved countries, where it can get higher returns. This may seem like a sensible idea, but what mainstream theory has failed seriously to address is that if you free up capital flows, money might not necessarily flow in. It might, instead, flow out. And the ways in which it may flow out might be unusually harmful.

Keynes understood the problem. "Advisable domestic policies might often be easier to compass, if the phenomenon known as 'the flight of capital' could be ruled out," he said. His words were prescient, for capital flight in his day was nothing when compared to the world-bending amounts that flood out of poor countries into the secrecy jurisdictions today.

He also knew there was a problem: Even in a world of tight capital controls, there would be leakage. Multinational companies needed permission to move investment capital overseas but had much more freedom in moving money for current purposes— that is, for financing trade and other day-to-day business. Of course, they could easily disguise a capital payment as a current one. To this, however, Keynes and Harry Dexter White had an answer. "What is often forgotten," the Canadian scholar Eric Helleiner notes, "is that Keynes and White addressed this with a further proposal. They argued that controls on capital would be more effective if the countries receiving that flight assisted in their enforcement."[18] In the earliest drafts of the Bretton Woods agreements, both Keynes and White had required that the governments of countries receiving the flight capital would share information with the victims of that flight. In short, they wanted transparency in international finance. Without the lure of secrecy, capital would have far fewer incentives to flee.

Enter Wall Street bankers and their lobbyists. U.S. banks had profited hugely from handling European flight capital in the 1930s, and, fearing that transparency would hurt New York's allure, they gutted the proposals. While early drafts of the IMF's Articles of Association had "required" cooperation on capital flight, the final version that emerged from the Bretton Woods conference saw that word replaced with "permitted." And through that one-word gateway drove a great, silent procession of coaches and horses across the Atlantic, laden with treasure from a shattered Europe. And the capital flight that ensued was as bad as Keynes and White had feared: A U.S. government analysis in June 1947, admitting that it only saw a part of the picture, found that Europeans held $4.3 billion in private assets, an enormous amount in those days, and far bigger than America's jumbo postwar loan to Britain that year.

American bankers were thrilled. And a new economic crisis exploded in Europe. America filled the hole with aid: the giant Marshall Plan of 1948. It is widely believed that the plan worked by offsetting European countries' yawning deficits. But its real importance, Helleiner argues, was simply to compensate for the U.S. failure to institute controls on inflows of hot money from Europe. Even in 1953, the authoritative New York Times correspondent Michael Hoffman noted, American postwar aid was smaller than the money flowing in the other direction.[19]

Henry Cabot Lodge, a Republican senator, was one of those who raised his voice to object to the stink. "There is a small, bloated, selfish

class of people whose assets have been spread all over the place," he said. "People of moderate means in this country are being taxed to support a foreign aid program which the well-to-do people abroad are not helping to support."[20] The comparison with Hillary Clinton's words about Pakistan can hardly be missed. These words would be painfully familiar today to citizens of Argentina, Mexico, Indonesia, Pakistan, Russia, Nigeria, and so many other nations that have watched powerlessly while local elites mount raids on their countries' wealth and collude with Western financiers and businessmen to hide it offshore, avoid paying tax on their income, and then expect Western aid donors to fill the gaps. The Marshall Plan had set the precedent: American taxpayers would foot the bill for policies that delighted Wall Street and its clients. What was presented as enlightened self-interest was substantially a racket, in the precise sense of a fraud, facilitated by public ignorance. As we shall soon see, the rackets have multiplied ever since.

Keynes died in April 1946, less than a year after the Nazis surrendered in Europe. The accolades poured in. "He has given his life for his country, as surely as if he had fallen on the field of battle," said Lionel Robbins, one of his most potent ideological adversaries. Friedrich Hayek, Robbins's former pupil who was just then fathering a new free-market ideology to dethrone Keynesianism, called him "the one really great man I ever knew."

Though Keynes had failed in many ways, many things he advocated were put in place, not least widespread capital controls. And events seem to have proved him right—or at least not wrong. The first two years after the war marked a brief period when U.S. financial interests dominated policymaking, and the restrictive international order was in abeyance. But the disaster that ensued, and the new economic crisis in 1947, discredited the bankers, and from the following year things became more restrictive.

The quarter century that then followed, from around 1949, in which Keynes's ideas were widely put into place, has become known as the golden age of capitalism: an era of widespread, fast-rising, and relatively untroubled prosperity around the world. As Britain's prime minister Harold Macmillan put it in 1957, "Most of our people have never had it so good." From 1950 to
1973, annual growth rates amid widespread capital controls (and

extremely high tax rates) averaged 4.0 percent in the United States and 4.6 percent in Europe. Not only that, but as the Cambridge economist Ha-Joon Chang notes, the per capita income of developing countries grew by a full 3.0 percent[21] per year in the 1960s and 1970s, significantly faster than the record since then. And from the 1970s, as capital controls were progressively relaxed around the world, and as tax rates fell and the offshore system really began to flower, growth rates fell sharply. The countries that have grown most rapidly, the top-ranking economists Arvind Subramanian and Dani Rodrik explained in 2008, "have been those that rely least on capital inflows . . . financial globalisation has not generated increased investment or higher growth in emerging markets."[22]

Average growth is one thing, but to get an idea of how well most people are doing, you need to look at inequality, too. In the offshore era from the 1970s onward, inequality has exploded in country after country. According to the U.S. federal Bureau of Labor Statistics, the average American nonsupervisory worker was actually receiving a lower hourly wage in 2006, adjusted for inflation, than in 1970. Meanwhile, the pay of American CEOs rose from less than thirty to almost three hundred times the average worker's wage. Nor is this just a story about growth and inequality. Another famous study found that between 1940 and 1971, a period mostly covering the time of the golden age, developing countries suffered no banking crises and only sixteen currency crises, whereas in the quarter century after 1973 there were 17 banking crises and 57 currency crises. A major new study in 2009 by the economists Carmen Reinhardt and Kenneth Rogoff, looking back over eight hundred years of economic history, concluded that, as reviewer Martin Wolf put it, "Financial liberalisation and financial crises go together like a horse and carriage."[23]

We cannot infer too much from these very different episodes. Other reasons exist for the high growth rates during the golden age, not least postwar rebuilding and productivity improvements during the war. The 1970s oil shocks go some way toward explaining the subsequent slide into crisis and stagnation.

Still, less drastic but nevertheless powerful conclusions do emerge. The golden age shows that it is quite possible for countries, and the world economy, to grow quickly and steadily while under the influence of widespread and even bureaucratic curbs on the flow of capital, and high taxes. China carefully and systematically restricts inward and

outward investments and other flows of capital, and at the time of writing it is growing fast. Clearly these kinds of controls, unfashionable for so many years, ought to be a policy option. Mainstream thinking on this is, at last, shifting a little: In February 2010 the IMF issued a

paper[24] outlining what would have been considered heresy just a few years earlier, arguing that capital controls are sometimes "justified as part of the policy toolkit" for an economy seeking to deal with surging inflows. Very often countries can, as Keynes believed, get along perfectly well with their own domestic credit systems and localized capital markets, without exposing themselves to the killer seas of global offshore finance.

What has happened since the golden age ended is not simply a return to the free movement of capital but financial liberalization on steroids. The offshore system that tore financial controls apart from the 1970s has been both an accelerator for flighty financial capital but also a distorting field, bending capital flows so that they end up not necessarily where they can find the most productive investment but where they can find the greatest secrecy, the most lax regulations, and freedom from the rules of civilized society. It would seem sensible to take our foot off the accelerator.

Quite soon after Keynes's death a new ideological insurgency took hold, based on an idea of the near infallibility of free financial markets, which overthrew Keynes's ideas. The Chicago economist Robert Lucas would write in 1980 that "at research seminars, people don't take Keynesian theorizing seriously anymore; the audience starts to whisper and giggle to one another." The latest financial crisis, which, I will show later, had its roots substantially in offshore finance, has helped resuscitate Keynes's ideas, at least in some circles. "If your doctrine says that free markets, left to their own devices, produce the best of all possible worlds, and that government intervention in the economy always makes things worse, Keynes is your enemy," wrote the economist Paul Krugman. "And he is an especially dangerous enemy because his ideas have been vindicated so thoroughly by experience."

Parallel with the ideological changes, however, something else began to emerge, even before the golden age ended. It first appeared in the City of London, before being embraced by Wall Street and spreading across the globe. Ideology mixed liberally with cash would create the conditions for the construction of a new world of offshore.

THE GREAT ESCAPE
How Wall Street Regained Its Powers by Going Offshore to London

AS THE BRETTON WOODS SYSTEM THAT KEYNES helped design got properly under way after the Second World War, Wall Street was tied down at home with domestic regulations, many dating from the Great Depression. Financial flows across borders were constrained, taxes were high, and the U.S. economy was growing very nicely indeed. Across the country working people were buying refrigerators, televisions, and new cars for the first time.

Wall Street bankers wanted an escape route. They found it in a new offshore market in the City of London, the financial district at the geographical center of the greater London metropolis.

Nobody quite agrees when this new strain of offshore activity first emerged, but it was probably first spotted by a financial regulatory authority in June 1955 when staffers at the Bank of England, the UK's central bank, noticed some odd trades going on at Midland Bank, now part of the globetrotting HSBC.[1] Exchange rates in those days were mostly fixed against the dollar, and banks in London were not supposed to trade in foreign currencies unless it was for financing specific trades for their clients, and they were not allowed to lend against deposits in foreign currencies. Midland Bank was apparently contravening UK exchange controls by taking U.S. dollar deposits that were not related to its commercial transactions, and it was also offering interest rates on these dollar deposits that were substantially higher than those permitted by U.S. regulations. A Bank of England official called in Midland's chief foreign manager for a chat, to ask why the bank was contravening official controls. Afterward he noted down that the Midland official "appreciates that a warning light has been shown."[2] Luckily for Midland, though, Britain was struggling to shore up its shaky foreign exchange reserves, and the Bank was reluctant to snuff out a

new area of international business. “We would be wise, I believe, not to press the Midland any further,” the Bank concluded.[3]

Regulation in the City of London in those days typically consisted of your being invited to the Bank of England for tea, where an eyebrow would be raised in your direction if you were out of line. The tradition in London then, as today, was to rely heavily on self-regulation by financial firms, in stark contrast to the United States and its regulatory authorities’ far more activist, rules- based approach. The City of London proceeded along the lines of a grand British Old Boys network, bound by elaborate rule and ritual. Discount brokers would wear top hats, and every evening in the rush hour a platoon of guardsmen would troop through the City in scarlet tunics and bearskins. “A banker could show his disapproval of sharp practice by crossing the road,” wrote Anthony Sampson in the 2005 edition of his book Anatomy of Britain. “Behind all the conventions lay the assumption of a club based on common values and integrity. It was a club which could easily work against the interests of the public or outside shareholders, through insider trading and secret deals; and it was based on cartels which could exclude competitors and newcomers. But it was also quite effective.”[4] A firm handshake and membership in the right kind of club was often enough to secure a man’s credit.

As in the United States, however, finance was still relatively closely tethered, at least when compared to today, and the City of London was deep in a slumber. “By Thursday afternoon at four,” one U.S. banker remembered, “one of the senior partners would come across to the juniors and say, ‘Why are we all still here? It’s almost the weekend.’”[5] Oliver Franks, a chairman of Lloyds Bank, compared it to driving a powerful car at 20 miles per hour. “The banks were anaesthetised,” Franks said. “It was a kind of dream life.”[6] American banks overseas were similarly quiescent.[7] For much of the time since the turn of the twentieth century they had been, as one account describes them, “courtesy stations where rich aunts could get their checks cashed or have a trust officer keep an eye on investments. Their nephews and nieces on short European tours used the bank, and so did a few vacationing businessmen.”[8] Ambitious U.S. business school graduates would prefer cutting-edge manufacturing jobs than stodgy, old-fashioned banking.

It is hard to imagine those days now: an era when international bankers took a backseat and fumed impotently at politicians’ mighty powers.

Those few years after the Second World War were, in fact, the only time in several hundred years when politicians had any real control over the banking sector in Britain. And with Midland's funny trades from 1955, and the Bank of England's decision not to interfere to stop it, that control began to unravel.

Just then, Britain's formal empire was starting to crumble too. India had secured independence in 1947, communist guerrillas were attacking British colonialists in Malaya, Egypt had broken free, civil war was breaking out in Sudan, and Ghana was preparing for independence. In July 1956, just over a year after the Bank started noticing Midland's funny trades, Egyptian president Gamal Abdel Nasser nationalized the Suez Canal. Britain and France, trying to adjust to their less magisterial postwar roles in world affairs but still driven by imperial-era motivations and arrogance, joined Israel in a three-sided invasion. It was a colossal mistake: The U.S. forced them to retreat, humiliated. "It marked, with brutal clarity, the end of Britain as a world power," said David Kynaston, historian of the City of London. It was the trigger for the collapse of the British Empire: Within a decade, an empire that had ruled over 700 million foreigners at the end of the Second World War shrank to a population of just five million.

As the empire crumbled, the pound—then fixed against the U.S. dollar at $2.80 per pound—began to totter and with it the whole edifice of solid, dependable imperial finance.[9] Coming less than a decade after Henry Morgenthau, the U.S. treasury secretary, had declared his intention to "move the financial center of the world from London and Wall Street to the U.S. Treasury," it was almost too much for the whiskery old gentlemen capitalists in London to bear.

In 1957 the British authorities, in a last-ditch attempt to rescue sterling's old imperial role, raised interest rates and applied new curbs on overseas lending to protect the pound. But the London banks, having noticed that the Bank of England had decided not to stop Midland's trades, sidestepped the new curbs by shifting their international lending away from sterling and

into dollars, in this new market. And here is the crucial part: The Bank of England not only did not stop Midland's trades, but it actively decided not to regulate the market either. It simply deemed the transactions not to have taken place in the UK for regulatory purposes. Since this trading happened inside British sovereign space, no other regulatory authority elsewhere was allowed to reach in and regulate it, either.

Banks in London began keeping two sets of books—one for their onshore operations, where at least one party to the transaction was British, which was regulated, and one for their offshore operations, where neither party was British.

A new offshore market had been born, which would become known as the Eurodollar market or the Euromarket.[10] It was no more than a bookkeeping device, but it would change the world.

The new unregulated Euromarket that emerged amid the dust and fire of Suez would grow explosively and become nothing less than the heart of a new British financial empire centered on the City of London. It would raise the City to even greater financial glories, provide a new playground for U.S. banks, and prove the key to resurrecting an old alliance between the City of London and Wall Street, helping each break the grip of their governments at home and restore them to their full powers.[11]

"As the good ship Sterling sank, the City was able to scramble aboard a much more seaworthy young vessel, the Eurodollar," wrote P. J. Cain and A. G. Hopkins, the leading historians of British imperialism. "As the imperial basis of its strength disappeared, the City survived by transforming itself into an 'offshore island' servicing the business created by the industrial and commercial growth of much more dynamic partners."[12]

Modern histories of the City of London's growth as a financial center point to the "Big Bang" of 1986—the sudden deregulation of London's markets under Prime Minister Margaret Thatcher—as the moment when London really took off in its modern form. But Tim Congdon, one of the City of London's most experienced spokesmen, spotted the real story. "The Big Bang," he wrote in 1986, "is a sideshow to, indeed almost a by-product of, a much Bigger Bang which has transformed international finance over the last 25 years. The Bigger Bang is—on all the relevant criteria—a multiple of the size of the Big Bang."[13] "An extraordinary situation has arisen where the Euromarket, which has no physical embodiment in an exchange

building or even a widely recognised set of rules and regulations, is the largest source of capital in the world."[14]

The scholar Gary Burn put it in a different light. The market's emergence, he said, was "the first shot in the neo-liberal counter-revolution against the social market and the Keynesian welfare state."

The modern offshore system did not start its explosive growth on scandal-tainted, palm-fringed islands in the Caribbean or in the Alpine foothills of Zurich or Geneva. It began its life in the City of London. American banks would soon dominate this market utterly. And, as is usual with so much that has happened offshore, very few people outside the financial sector even noticed.

Before proceeding with this tale, it is essential to understand something peculiar about the City of London.

Few British people, let alone anyone else, know that the City of London is the most important financial center in the global offshore system. Before getting properly into the strangeness of this ancient city, some of its more obvious offshore qualities are worth noting.

London's first claim to be a tax haven is the subject of this chapter: its role as the creator and developer of the Euromarkets, Wall Street's giant escape route from the checks and balances of U.S. financial regulation. Here the subsidiaries and affiliates of U.S. commercial banks have long been allowed to engage in, among many other things, investment banking—"casino banking," as some have called it—something the Glass-Steagall Act of 1933 explicitly prohibited. Over the years, as this business became more integral to their global banking models, Wall Street could increasingly pressure the U.S. government to do away with the original restrictions to allow them to do at home what they already did offshore, and this was arguably the main factor that led to the repeal of Glass-Steagall in 1999. It was the classic offshore pattern: banks find an offshore escape route, then say in Washington, "We can already do this offshore—so why not here?"—and domestic regulations get relaxed.

London provides endless loopholes for U.S. financial corporations, and many U.S. banking catastrophes can be traced substantially to those companies' London offices. The unit that blew up the insurance company American International Group (AIG), putting the U.S. taxpayer on the hook for $182.5 billion, was its four hundred–strong AIG Financial Products unit, based in London. The court-appointed examiner looking

into the collapse of Lehman Brothers in September 2008 found it had used a trick called Repo 105 to shift $50 billion in assets off its balance sheet, and that while no U.S. law firm would sign off on the transactions, a major law firm in London was delighted to oblige, without breaking the rules.[15] When the United States introduced the Sarbanes-Oxley regulations to protect Americans against the likes of Enron or Worldcom, the City of London did not follow, and more U.S. financial business flowed to London.

Another important role for London has concerned a seemingly arcane practice known as "rehypothecation,"[16] a way of shifting assets off banks' balance sheets. The U.S. has firm rules to curb the abuses, but London does not—so ahead of the latest crisis, Wall Street investment banks simply went off to London where they could do it without limit. A little-noticed IMF paper in July 2010 estimated that by 2007 the seven largest players in the market—Lehman Brothers, Bear Stearns, Morgan Stanley, Goldman Sachs, Merrill/BoA, Citigroup, and JPMorgan—had shifted $4.5 trillion off their balance sheets in this way. So this London-based practice injected trillions more debt into the financial system than would otherwise have been the case.[17]

The City of London and Wall Street banks got rich off this—and ordinary Americans will pay for it for years to come.

World oil markets are also affected by the London loophole. In June 2008, as world oil prices soared amid uproar about market manipulation, former regulator Michael Greenberger noted in testimony to a U.S. Senate Committee[18] that the U.S. Commodity Futures Trading Committee (CFTC), the regulator for energy derivatives, had been pursuing a "continuous charade that a U.S. owned exchange (ICE) located in Atlanta and trading critically important U.S. delivered energy products should be regulated by the United Kingdom, whose regulation of these markets is self evidently lacking." Almost every Russian firm listing overseas chooses London, not New York, partly because of Britain's permissive governance standards. The list of London loopholes goes on.

The next component of the City's offshore status is its role in running, protecting, and being fed by Britain's offshore spiderweb. As a reminder, this web of partly British tax havens around the world provides the City with three things. First, it captures passing foreign business and assets nearby and channels them, and the business of handling them, to London, just as a spiderweb catches insects. Second, it is a storage mechanism for assets. Third, it is a kind of money-laundering

filter that lets the City get involved in foreign dirty business but at sufficient distance to minimize the stink. In the second quarter of 2009, the UK received[19] net bank financing of $332.5 billion just from its tax havens of Jersey, Guernsey, and the Isle of Man; in June

2009 the British web as a whole held an estimated $3.2 trillion in offshore bank deposits, half the global total, according to data from the Bank for International Settlements.

London's next offshore attraction is secrecy. Britain does not practice Swiss bank secrecy, which would make its violation a criminal offense, but it uses other equally effective mechanisms. The British spiderweb is a big part of this story, as is UK trust law. When Denis MacShane, a former British foreign office minister, criticized bank secrecy at a European seminar, his opposite number from Luxembourg retorted: "Have you ever examined UK trust law? All our bankers and financial lawyers say that if you really, really want to hide money, go to London and set up a trust." [20] Britain offers all manner of other secrecy facilities. Under UK law, for example, offshore companies can be directors of UK companies, and it is usually impossible to know who the real owners are.[21]

Another London attraction is the so-called "domicile" rule, whereby wealthy foreigners can come to live in England and escape tax on all their non-UK income. In pursuit of this tax break, the world's super-rich—from Greek shipping magnates to Saudi princesses—have descended on London in hordes. Having gone out of its way to welcome wealthy Arabs since the 1980s and rich Japanese and oil-rich Africans since the 1990s, the City has more recently aggressively courted Russian oiligarchs, offering them an almost tax-free bolt-hole beyond the reach of Russian law enforcement: Alexander Zvygintsev, Russia's deputy prosecutor-general, describes "London-grad," as it is sometimes known, as "a giant laundrette for laundering criminally sourced funds."[22]

The contrast between London and New York, in terms of tolerance for criminal behavior, is stark. In January 2009, for instance, U.S. law enforcement fined the British bank Lloyds TSB $350 million after it admitted to secretly channeling Iranian and Sudanese money into the U.S. banking system. Robert Morgenthau, the Manhattan district attorney, explained how Lloyds would routinely strip out identifying features from payments from Iran so that wire transfers would pass undetected through filters at U.S. financial institutions.[23] In the City of London, this business just went on unperturbed.

"In America they send hundreds of people to jail: in this country bankers don't go to jail," explains the British author and publisher

Robin Ramsay. “There are no consequences in London.” Though Americans may roll their eyes at this, as they consider the financial crimes that have gone unpunished at home in the wake of the latest financial crisis, there is no doubt that London’s tolerance for abusive or criminal financial behavior is in a class of its own. The Paris-based investigating magistrate Eva Joly, who broke open the Elf Scandal in Paris, described another view from overseas: “The City of London, that state within a state which has never transmitted even the smallest piece of usable evidence to a foreign magistrate.”

The next part of the City of London’s offshore armory is the strangest one. It concerns an organization called the City of London Corporation. On the face of it, the Corporation of London, as it is sometimes known, is merely the municipal authority for City of London, a 1.22 square mile of prime financial real estate located at the geographical center of the physical, sprawling metropolis of greater London. But the Corporation of London is far more than a municipal authority. It is a lobbying organization for the financial sector that is so deeply embedded in the fabric of the British nation-state that it has become impossible in Britain, even after the greatest financial crisis since the Great Depression, to confront or even seriously check the power of finance. Without understanding the Corporation of London, one cannot properly understand how Wall Street has become so powerful in the United States.

At its broadest, the term City of London refers to the financial services industry based in Britain, mostly located inside the so- called Square Mile that is the City. Smaller clusters of financial services activity exist elsewhere: The hedge funds in Mayfair a few underground stops farther southwest and the newer Canary Wharf, three miles east along the Thames river, are also important, hosting the spillover from the overloaded City. Neither these upstarts nor other small financial poles in places like Edinburgh or Leeds are really rivals to the Square Mile. The Corporation of London spreads a protective mantle over them all.

London hosts more foreign banks than any other financial center. In 2008 the city accounted for half of all international trade in equities, nearly 45 percent of over-the-counter derivatives turnover, 70 percent of Eurobond turnover, 35 percent of global currency trading, and 55 percent of all international public offerings.[24] New York is bigger in areas

like securitization, insurance, mergers and acquisitions, and asset management, but much of its business is domestic, making London easily the world's biggest international—and offshore—financial hub.

The head of the Corporation of London is the Lord Mayor of London—not to be confused with the mayor of London, who runs the much larger greater London municipality that contains the City, geographically speaking, but has no jurisdiction over its nonmunicipal affairs. And this separation of powers matters.

When the Queen visits the City, she stops at the boundary at Temple Bar and waits for the Lord Mayor of the City, accompanied by assorted City Aldermen and Sherriffs. This tourist ceremony, in which the Queen touches the Lord Mayor's sword, strikingly highlights the political discontinuity between the City and the rest of Britain. When heads of state visit Britain the Lord Mayor throws more lavish banquets than the Queen. Each year the Chancellor, Britain's finance minister, makes a speech at the Guildhall, the seat of City government, and at the Lord Mayor's Mansion House, in which they justify how they have been serving the interests of finance.

The City's nine thousand–odd human residents have one vote each in municipal elections here. But businesses in the City vote too, as if they were human, with thirty-two thousand corporate votes.[25] In effect, Goldman Sachs, the Bank of China, Moscow Narodny Bank, and KPMG can vote in a hugely important British election.

The strangeness goes deeper and deeper. In fact the Corporation is so ancient and mystifying that barely any outsiders understand it.

The Corporation's website is a warren of tunneling links and unexpected, bizarre connections. A series of rituals confirm the integrity of the whole. There are 108 livery companies, including the Worshipful Companies of Broderers, and of Cord-wainers. The current Lord Mayor, Nick Anstee, is an honorary Liveryman of the Plaisterers' Company.[26] There are the Sheriffs, Aldermen, the Court of Common Council, and the "Rules for the Conduct of Life." There is the Lord Mayor's show, resplendent with arcane ritual, gilded coaches, and elderly men in long satin robes, that is watched by millions on the BBC every November.

The Corporation has existed since what tour guides and historians call time immemorial, a term taken to mean that its origins extend beyond the reach of memory, record, or tradition. There is no direct evidence, Corporation officials note, of it coming into being: They say, only half in jest, that it dates its "modern period" from the year 1067. This is the world's oldest continuous municipal democracy, predating

the British parliament and rooted in what the Corporation calls “the ancient rights and privileges enjoyed by citizens before the Norman Conquest in 1066.” This, notes the City of London expert Maurice

Glasman, means that the City is effectively outside the normal legislative remit.

The City's special privileges stem ultimately from the power of financial capital. Britain's rulers have needed the City's money and have given the City what it wants in exchange. Over the centuries the City has used this magic formula to carve out for itself privilege after privilege, exempting itself from laws it dislikes and turning itself into a state within a state: a true offshore island partly separate from Britain and protected from tides of history that have swept the British nation-state over the centuries.[27] Monarchs, firebrands, and demagogues who tried to roll back the City's special rights and privileges had occasional successes, but most came to a sticky end, and the City vigorously reasserted its rights. It was, one nineteenth-century reformer said, "like some prehistoric monster which had mysteriously survived into the modern world."

In 1937, Britain's then prime minister Clement Attlee became one of few politicians to have raised the issue. "Over and over again we have seen that there is in this country another power than that which has its seat at Westminster [the parliament]. The City of London, a convenient term for a collection of financial interests, is able to assert itself against the Government of the country. Those who control money can pursue a policy at home and abroad contrary to that which has been decided by the people."[28] In 1957 an official commission, which sparked a big shake-up of local government across Britain, opened with the memorable words: "Logic has its limits and the position of the City lies outside them."[29]

The carve-out from Britain's rules and laws has a truly ancient pedigree. When William the Conqueror invaded England in 1066, the rest of England disarmed and gave up its rights—but the City kept its freehold property, ancient liberties,[30] and its own self-organizing militias: Even the King had to disarm in the City. When William commissioned the Domesday Book, a survey of the kingdom's assets and revenues that determined taxation, the City was excluded.[31] In the momentous changes that followed—the Protestant Reformation five hundred years later when the English Church became subject to the Crown, the subsequent civil wars that broke the power of the monarchy, and the broadening of suffrage to include almost all adults—the City held on to its privileges and strengths. The Statute of William and Mary from 1690, "confirming the Privileges of the Corporation," and following a challenge to the City's

authority by the late King Charles II, illustrates the scale of the City's different status:

> All the charters, grants, letters patents, and commissions touching or concerning any of their liberties or franchises, or the liberties, privileges, franchises, immunities, lands, tenements and hereditaments, rights, titles, or estates of the mayor and commonalty and citizens of the City of London, made or granted to any person or persons whatsoever . . . be and are hereby declared and adjudged null and void to all intents.

In other words, those claims that infringe the City's ancient liberties are worthless. Earlier that century, the British crown had asked the Corporation to extend its ancient legal protections and privileges to new areas of London, outside the City, that were receiving tens of thousands of refugees from brutal land reforms known as the Enclosures. But the Corporation refused, instead shipping excess populations off to the Ulster Plantation and the Corporation of Londonderry in what is now Northern Ireland,[32] helping build a large Protestant community there and contributing to bitter future conflict. Glasman calls this the "Great Refusal": the moment where the City turned its back on London and when London's history properly became a tale of two cities, with a mayor for the vibrant, troubled, and poverty-scarred metropolis, and a Lord Mayor for the City: the world's most ancient political institution, at the disposal of finance.

For much of the last century the Labour Party, the party of Britain's working class, had a pledge into its manifesto to abolish the Corporation of London and fold it into a unified London government. The pledge would remain in place, unfulfilled, until Labour Leader Tony Blair undid it in the early 1990s. In exchange for the City's support in his successful bid for power in 1997, he agreed to remove the pledge to abolish the Corporation and replace it with one to "reform" it instead. The reform he eventually delivered reinforced the corporate vote, further diluting the humans.[33]

Today the City has an official named the Remembrancer, the world's oldest institutional lobbyist, who is the only nonparliamentary person working in the parliamentary chamber. Currently a man named Paul Double, the Remembrancer is charged "with maintaining and

enhancing the City's status and ensuring that its established rights are safeguarded,"[34] and he monitors, and lobbies on, anything in parliament that might touch on the City's rights.[35] At the time of writing in 2010 its most recent public memoranda included one arguing stridently against efforts to rein in hedge funds,[36] and another largely seeking to absolve over-the-counter derivatives of helping cause the financial crisis, and arguing against restricting them.[37] The City of London Corporation also has a pot of money at its disposal named City Cash, which it says is "a private fund built up over the last eight centuries," earning income from "property, supplemented by investment earnings."[38] City Cash funds many things, including monuments and ceremonies, stakes in the property developments[39] outside the City boundaries, free-market think tanks, and permanently staffed lobbying offices from Brussels to Bombay to Beijing.[40] The City will not provide a detailed list of its assets and holdings: some, but not all, are available on the public record. It admits to owning some of the most valuable part of London's West End bordering the world famous Regent and Oxford Streets.[41] The City's Cash is exempted from British Freedom of Information (FOI) requests, so we cannot find out what it owns. Jason Beattie, a reporter who sought to investigate this money pot, found it to be completely different from any other local authority fund he had ever encountered. "I FOI'd them to hell—and I got nowhere," he remembers. Does it own property around Wall Street, as Glasman suspects? There is no obvious way to find out.[42]

Some law made in the British parliament does apply to the Corporation, but some Acts of Parliament specifically exempt it, either fully or in part. The City is connected to the British nation-state, but it remains a constitutional elsewhere. In this the City resembles Jersey or the Cayman islands, the offshore jurisdictions that are its satellites—each of which, as I will show, has also been entirely captured by the interests of global finance.

For skittish global capital, the City's constitutional foundation matters absolutely. Finance knows that any serious challenge to the City would face the mystique of time immemorial and the extravagant skills and powers of the many servants of finance. This globe-encompassing financial services center, whose influence reaches silently into people's homes from Baltimore to Birmingham to Borneo, is founded upon an ancient constitutional platform that is unique and rather impregnable.

This detour through British constitutional history helps us understand a little more about the power of financial capital and its ability to escape offshore to fortified and deregulated spaces, protected from outside interference. It is no coincidence that the futuristic Euromarkets, this new playground for Wall Street, emerged here in this ancient City. This market and its subsequent

spin-offs would, as we shall see, ultimately play a central role in forcing through the liberalization of the world economy, whether the world's citizens liked it or not. The City had created a new banking order; a new form of money, a new market in which to trade it, and the means by which the City of London would reemerge, phoenix-like, from the ashes of empire.[43] The project to restore the City to postimperial glory, the academic writer Gary Burn notes, "was pursued unhesitantly and unstintingly, without, it seems, any prior or subsequent debate by the Prime Minister, the Treasury, by Cabinet, Government or Parliament. Central to the success of this project was the Bank of England, which after 1945 set about reestablishing the hegemony of international financial capital."

From those early beginnings the Euromarkets spread like a forest fire, fueled by political events. The Soviet Union did not want to hold too many dollars in New York, where they risked being confiscated if the Cold War turned nastier, and they did not want to invest in Sterling either: the risky money of a collapsing empire. In this new liberated Eurodollar market they found their solution: They could hold the money in dollars in London, under the protection of an ancient, rather unaccountable institution with no qualms about the political origins of money. Starting with a deposit of a few hundred thousand dollars by the Moscow Narodny bank in 1957, the Soviets began to pile in. Karl Marx would have raised his prodigious eyebrows at the irony of avowedly Marxist nations nurturing the emergence of the biggest, most unfettered capitalist system in history.

By late 1959 about $200 million or so was on deposit in the Euromarket in London; by the end of 1960 it had reached a billion, and a year later the total was $3 billion, by which time it was spreading to Zurich, the Caribbean, and beyond.

In 1963 the market received two more major fillips. The first came on July 18 when President Kennedy introduced his so- called Interest Equalization Tax on income from foreign securities, which was supposed to curb U.S. dollar outflows by making it less attractive for U.S. bankers to lend overseas. Wall Street responded by doing their lending out of the offshore, tax-free Euromarkets instead. "This is a day you will remember," said Henry Alexander of Morgan Guaranty bank when the new regulations came into force. "It will change the face of American banking and force all the business to London."[44] The second boost that year was the birth of Eurobonds: unregulated offshore bearer

bonds, which are just what the name suggests: whoever bears the pieces of paper in their hands owns them. They are a bit like ultravaluable dollar bills: No records are kept of who owns them, and they are perfect for tax evasion. Bearer bonds feature in villain-infested Hollywood movies like Beverly Hills Cop and Die Hard, and they are considered so pernicious that many countries have since outlawed them. A Bank of England memo from 1963 crystallizes the cynicism. "However much we dislike hot money, we cannot be international bankers and refuse to accept money."[45]

That year American banks were treated to a display of the Bank of England's political muscle when the Bank's governor Lord Cromer forced Britain's new prime minister Harold Wilson to throw away half his election promises and slash government spending, prompting Wilson to shout in one debate, "Who is Prime Minister of this country, Mr. Governor, you or me?"[46]

Though the Bank of England is accountable to parliament, not to the City of London Corporation, its physical location at the geographical center of the City—just across the road from the Lord Mayor's Mansion House—reflects where its heart lies: in a shared view, established over centuries, that the path to progress lies in deregulation and freedom for financial capital—with the City at the forefront. The Bank's purpose was never defined very clearly, but when the Bank's directors decided in 1991 to work out more explicitly what the Bank is for, they came up with three main goals. Two were the usual central bankers' goals: to protect the currency and to keep the financial system stable. The third was, as the Bank's then governor Eddie George put it, to "ensure the effectiveness of the United Kingdom's financial services" and to have a financial system "which enhances the international competitive position of the City of London and other UK financial centres."[47] He was effectively admitting to a Bank goal to do what it takes to protect and promote the City at the center of an overseas, or offshore, empire.

A quick numerical exercise shows how unregulated offshore finance can be so profitable, far beyond the potential merely for eliminating taxes.

Governments require banks to hold reserves against the deposits they take. Let's imagine a bank officially has to hold 10 percent of the value of its deposits in cash, and the going interest rate is 5 percent annually for loans and 4 percent for deposits. For every $100 deposit, the bank may

only lend $90 at 5 percent, earning it $4.50. The bank must pay the depositor 4 percent, leaving it 50 cents. Subtract the bank's operating costs of, let's say, 40 cents, and it has made 10 cents' profit on its $100 in deposits.

Now imagine, instead, a bank in the Euromarkets in London, which has no reserve requirements. The bank can now lend all of its $100 at 5 percent, earning $5. Subtract $4 to pay interest to the depositor, then subtract 40 cent operating costs, and the profit now is 60 cents—six times the "onshore" profits. This is grossly simplified, but it exemplifies a basic principle behind offshore's appeal. On the face of it, this looks like a cost-free benefit for everyone: In a competitive market, the bankers will pass some of those profits on to borrowers and depositors. But this is a false view. First, much of the profit will pass to the bank's wealthy owners, and to the extent that the banks do pass on these savings, offshore customers will almost always be the world's wealthier citizens and corporations. Second, the increased profits come at a cost: increased risk. The latest financial crisis has showed what happens when such risks materialize: ordinary people pay. Free money for bankers and for the world's wealthy—at the expense of everyone else—is a basic leitmotif of the offshore system.

There is another offshore secret at play here too. It hinges around why banks have to hold reserves against deposits in the first place.

Imagine you deposit $100 with an "onshore" bank. Under a 10 percent reserve requirement, the bank may lend out only $90 of that to someone else. That person now has $90 to spend, and that $90 will end up in another bank account. That next bank may then lend 90 percent of that $90 out—so $81 more will end up being lent. And the process goes on. This is a well-known principle of so-called "fractional reserve banking," and if you follow the calculations through you will find that with a 10 percent reserve requirement your $100 theoretically balloons out into $1,000, spread across the economy. Money really is conjured out of thin air like this: This is what banks do. Money is created by the act of lending it. "The process by which money is created is so simple that the mind is repelled," said the economist J. K. Galbraith. Money creation is not a bad thing in itself. The question is: how much borrowing, and how much money creation, is healthy? Regulators try to control liquidity—making sure that the amount of money sloshing around the system does not grow out of control—by enforcing reserve requirements.

But in the unregulated London-based Euromarkets, with no reserve requirements, the first $100 deposit theoretically lets the bank lend out

the full $100, which turns into another $100 deposit, leading to another $100 loan, and so on endlessly. Of course it never happened like that: If it had, we might have drowned in money long ago. No, there is only so much demand for credit at

any time, and if credit grows in the offshore market it will, up to a point, be reined in elsewhere to compensate. Offshore Eurodollars also leak back "onshore," where reserve requirements will slow down the money-creation machine again. And prudent bankers hold back reserves anyway, even when they do not have to. Controversy has, in fact, raged for decades about how much the Euromarkets contribute to puffing up the amount of money circulating in the world, boosting risk and building unsustainable wobbly pyramids of debt.

Yet some things seem clear. An unregulated market allowing potentially endless and unusually profitable money creation will expand and displace regulated banking, and lending will expand into places where it wasn't previously able to and often to where it shouldn't be. Credit quality is likely to deteriorate, out of sight of regulators. Just as the world was waking up to the ideas of Milton Friedman, who argued that governments should focus on money supply as the lever to use to manage their economies, the new London market was starting to make these levers ineffective.

If the 1960s were thrilling for American bankers in London, U.S. regulators weren't so happy. The archives from that era show that people were fretting about exactly the kinds of trouble that brought the world economy to its knees in the recent economic crisis from 2007—uncontrollable financial flows across borders, and the financing of long-term lending with very short-term borrowing, risking trouble when short-term markets dry up. "Is the growth of this market a welcome tonic, or a slow poison to the international financial system in general?" The Banker magazine had asked in the earlier years of the Euromarkets' growth.

In 1960 the Federal Reserve Bank of New York, believing that the Eurodollar markets were already making "the pursuit of an independent monetary policy in any one country far more difficult,"[48] sent a team to London to investigate. Bank of England staff charmed the American regulators and doubtless offered them a great number of cups of tea. But they did little to address their concerns, even after the Americans said the Euromarkets posed a danger to stability—and even though some British officials were nervous themselves. "I did get the impression," one Bank of England official noted in a memo in 1960, "some of them were rather keeping their fingers crossed."[49]

James Roberston, vice chair of the Federal Reserve, started to point to

another worry: the emerging Euromarket centers in the City's offshore satellites like Cayman and the Bahamas. "My primary objection is that they aren't branches in any sense of the word," he wrote. "They are simply desk drawers in somebody else's desk. Why make banks go through a sham proceeding to obtain certain privileges?" One enterprising trader at a major U.S. bank, recognizing how artificial this game was, planted a cardboard sign saying "Nassau" on a desk in his trading room in New York and recorded trades at that desk, booking them "offshore" and out of sight of regulators. After someone discovered the ploy the traders continued as before but ensured that a clerk simply copied them into a second set of books in the Bahamas.[50] Soon, a shift to computerized trading removed the need for cardboard signs anyway. As the author Jeffrey Robinson noted, "The horse hadn't merely bolted, it was living in a beach-front condo in the Caribbean."

The Euromarkets rippled outward, driven from the center in London, first to Britain's semi-independent Crown Dependencies of Jersey, Guernsey, and the Isle of Man near the UK mainland, then out to the British-held Caribbean jurisdictions, then to Asia, and finally to British-held Pacific atolls. These satellites of the City were simply booking offices: semifictional way stations on secretive pathways through the accountants' workbooks. The banks might park a person or two on each palm-fringed island while the heavy lifting work—the real business of hammering together big banking syndicates, making the accounting cogs mesh properly, and ensuring that the paperwork was legally watertight—happened in London and New York. But these fast-growing, freewheeling hidey-holes helped the world's wealthiest individuals and corporations, especially the banks, to grow faster than their more heavily regulated on-shore counterparts.

By 1963 the U.S. Treasury already was warning that the market had aggravated a "world payments disequilibrium,"[51] and one official suggested publicly that American bankers should "ask themselves whether they are serving the national interest by participating in this sort of activity."[52] That was the year that President Kennedy introduced his Interest Equalization Tax, which drove U.S. banks to London in droves. "It is hardly an exaggeration to say that leading American banks thought little about Europe before 1963," wrote the U.S. economist Richard Sylla, "and thought about little else in the decade thereafter.[53]

Once again the U.S. authorities conveyed their fears to the Bank of England and sent the U.S. comptroller of the currency to London to inspect American banks. The Bank of England's response was,

effectively, that the United States could go and screw itself. “It doesn’t matter to me whether Citibank is evading American regulations in London,” one top Bank official said, epitomizing the City of London approach. “I wouldn’t particularly want to know.”[54]

As the 1960s wore on, U.S. deficits ballooned. America was overspending overseas, in relation to its earnings, and its foreign payments sent an army of dollars outward from the United States, feeding the Euromarkets and further loosening the shackles on finance—just as Swinging London, as it became known, was breaking the constraints of fashion. Ideas about rebellion against authority percolated far into the fabric of society: James Bond’s forays offshore, to Switzerland in Goldfinger in
1964 and to Nassau in Thunderball in 1965, injected an appealingly subversive frisson into the image of tax havens and uncontrolled offshore finance, the new global hothouse for international crime.

By 1967 Robert Roosa, the energetic U.S. undersecretary for the Treasury, warned that the Euromarkets had hugely amplified destabilizing capital flows, “in magnitudes much larger than anything experienced in the past, massive movements.” The response from London always came in two forms: either “This is nothing to worry about” or “Mind your own business.”

A bizarre, Alice in Wonderland logic lay behind the Bank’s decision not to regulate these markets—the sort of logic that permeates the offshore system. If there were a run on a regulated bank in London, the Bank of England, by virtue of being its regulator, would feel some obligation to come in and pick up the pieces. In other words, regulation, as a Bank of England memo put it, “would mean admission of responsibility.” Better, then, the logic went, not to regulate them![55]

And the Euromarkets just kept blooming. More and more U.S. banks flooded to open offices in London. The publication Euromoney, in its inaugural issue in 1969, described the market as being like a child: “It stuffs itself for some time with whatever goodies take its fancy, refuses to listen to warnings that it will get indigestion, gets it, lies low for a few months, then gets hungry again.”

That year the biggest bank in the market was Citicorp (or Citibank), whose CEO Walter Wriston was a single-minded champion of the idea of freedom for financial capital, who delighted in the way that governments were once more being cowed by financial markets. “The Euromarkets are now the greatest mobile pool of capital in the world,” Wriston said in one interview. “If the British put on reserve requirements

or other controls, Bahrain is waiting. In just a couple of keystrokes, the whole market could be gone." And his love for the Euromarkets was, it seems, matched by his confidence in their resilience. When asked in

an interview in 1996 about the Euromarkets whether the world risked financial meltdown on account of increasingly risky financial activities, he said simply, "It can't happen."[56]

By 1970 the London-centered market was measured at $65 billion in all currencies and still growing fast. Daniel Davison, the head of Morgan Guaranty's London office, gushed about London's minimal regulation and generous tax treatment. It was, he said, "a banking bazaar unrivalled in history. The Moscow Narodny Bank, whether it is appropriate Bolshevik doctrine or not, sits almost cheek by jowl with the Bank of China, and rubs elbows with the capitalist banking institutions of the West. There are about three times the number of American commercial banks in the City as there are in New York. The City of London beats Baghdad as a bazaar by a country mile."

The whole character of the City began to change. City gentleman reeled at the sight of Goldman Sachs's star trader, Larry Becerra, turning up for work on a Harley-Davidson in jeans and cowboy boots, and at the sounds of "holy fucking shit" that began to fill the dealing rooms. Within a few years of Goldman Sachs's opening its first international office in the City in 1970, its London operation was accounting for a quarter of the firm's entire business and its offshore satellites a slice more. "The days of friendly co-operation and friendship changed dramatically in the mid-seventies when it became an ugly business," remarked one British banker, John Craven. "That's when unpleasant practices came in—in terms of paying investors under the table in order to take bonds and even a little bit of improper entertainment of guests in flats in London—and it undermined the whole spirit of the thing."[57]

All the time, the Bank of England quietly kept regulation at bay. In 1973 some German bankers went to see James Keogh, a Bank of England official, to ask what permissions they needed to become an authorized bank in London. "Keogh looked at us," one banker remembered, "and he said 'a bank is a bank if I consider it to be one.'" And that, pretty much, was it—apart from what the historian David Kynaston calls the "occasional, indispensable afternoon ceremony": that cup of tea at the Bank of England from time to time to explain what you are doing.[58] By that year, over half of U.S banks' foreign business was taking place in London—though a lot of that soon began shifting toward London's satellite tax havens, especially the Bahamas and the Caymans.[59]

By 1975 the invading Wall Street ruffians had fully overtaken the plodding British banks and were beating them in market after market.

"There was never any sense that old English bankers were competing with us in any way," said Michael Lewis of Salomon Brothers. "It was much more, 'how much did we have to pay them to clear out of town and do something else with their lives.'"[60]

By then, the Euromarkets had grown to exceed the size of the entire world's foreign exchange reserves.[61] At the same time, a new source of dollars had begun to feed the markets, as the OPEC oil shocks hit in the 1970s, and oil-rich countries' surpluses were re-lent through the Euromarkets to finance deficit-plagued oil consumer countries. This gigantic financial recycling via London and its satellites, to be lent out to Latin America and elsewhere, often amid great secrecy and corruption, laid the foundations for the subsequent debt crises of the 1980s.

As the Euromarket bonfire raged ever more strongly, financial capital began a new assault on the citadels of power and the democratic nation-state. Countries were no longer insulated by exchange controls and capital controls against events elsewhere. The Euromarkets seemed to have connected up the world's financial sectors and economies as if by an electric current: A shock rise in interest rates in one place would switch its effects instantly to anywhere plugged into the system. Tides of hot money once again began to surge back and forth across the globe, with the Euro-markets as a kind of anti-Keynesian global transmission belt making financial markets more sensitive to tweaks and changes elsewhere and allowing enough money to pool together in one place to allow large speculative attacks against currencies.[62] Democratic governments began to retreat in the face of financial capital. "What annoys governments about stateless money is that it functions as a plebiscite on your policy," Wriston said. "Money goes where it is wanted and stays where it is well treated. This annoys governments no end."[63]

The Euromarkets just kept snowballing: $500 billion in 1980, then a net $2.6 trillion eight years later[64]; and by 1997, nearly 90 percent of all international loans were made through this market. It is now so all-enveloping that people hardly notice it anymore.

It is fairly easy to explain why Britain welcomed the new markets, even at the cost of squeezing out British banks. There was the crude question of

money, for one thing. “We, at the Bank, have never seen any reason to place any obstacles in the way of London taking its full and increasing share,” one official said. “If we were to stop the business here, it would move to other countries with a consequent loss of earnings for London.”[65] Not only that, but Britain was rolling out a new political and economic strategy to make up for its loss of status as the world superpower: It would keep as close as possible to a leadership role in world affairs by hitching itself to the new American superpower through a “special relationship” with Washington, which endures, at least in British minds, until the present day. The economic anchor of this special relationship has been this partnership between Wall Street and the City of London, under a simple offshore formula: give Wall Street banks what they want, and they will come.

Yet if it is obvious that the British would welcome this market, it seems rather odder that the United States would let its banks dive headfirst into this unregulated offshore market, knowing they were undermining American financial controls. Several things help explain why it was tolerated in Washington too.

Wall Street lobbying was obviously a huge part of the story. There is also the classic offshore problem: what goes on overseas, out of sight, gets ignored. Many policy-makers and regulators in the United States simply failed to understand this strange new phenomenon or dismissed it as a weird, slightly unclean, but temporary anomaly[66]: a funny money best left to Europeans. “Euro-dollars, indeed!” one U.S. banker told Time magazine. “It’s hot money—and I prefer to call it by that name.” And it was hot money.

U.S. banking interests worked hard to keep this offshore playground as quiet as possible too. Bankers deliberately avoided discussing it,[67] and when Hendrik Houthakker, a junior member of the U.S. Council of Economic Advisors, wanted to tell the U.S. president about the Euromarket, he was slapped down by his superiors with, “No, we don’t want to draw attention to it.” A U.S. congressional committee report in 1975 expressed amazement at how it had flourished so far beneath the political radar for so long.[68] Yet there is a bigger reason why the United States ultimately colluded with Britain in letting Wall Street banks roam offshore.

The U.S. dollar is the world's main reserve currency. Less privileged nations are periodically constrained from spending by shortages of foreign exchange, but the nation with the dominant currency can borrow in its own currency—and it can print money to acquire real resources and live beyond its means for a long time. This "exorbitant privilege" helped America fight and pay for the Vietnam War; more recently it helped President George W. Bush cut taxes, invade Iraq, and rack up huge deficits while investors around the world continued to buy U.S. debt. Countries choose dollars as the main component in their reserves because dollar markets are large and liquid, and the dollar is trusted to be relatively stable. Everyone trades in dollars. When I was the Reuters correspondent in war-ravaged Angola in the mid-1990s, the raucous street money changers plumped up their ample brassieres not with Euros, Swiss francs, or Renminbi—but with dollars. Dollars make the world go round, and if you print the stuff, you've got it made.

To claim reserve status, a currency must have huge, deep, liquid, and sophisticated markets—and a currency subject to capital controls and stringent financial regulations is less attractive. U.S. policymakers wanted these deep markets but did not want to give up their taxes and controls. They thought, let's have our cake and eat it, by preserving the rules and constraints at home while permitting this unregulated dollar market to flourish overseas. What they had not appreciated enough was the extent to which this offshore market would rebound back into the United States, with malign effects.

By the time Margaret Thatcher and Ronald Reagan came to power in 1979 and 1981, the political classes in Britain and the United States were losing faith in manufacturing and genuflecting toward finance. Wall Street and the City of London were at the forefront of a global trend of financialization: the reengineering of manufacturing firms as highly leveraged investment vehicles and, soon, the packaging of mortgages into risky asset backed securities for offloading into global markets. Everything was for sale: school playing fields, post offices, army services, and old fish markets. In the offshore centers, the very sovereign laws of nation-states had become available for sale or rent.

After Thatcher's giant deregulatory "Big Bang" of 1986 deepened London's offshore status as a freewheeling, anything-goes financial center, "light-touch London" broadcast ever stronger antiregulatory

impulses around the world, deregulating other economies and their banking systems as if by remote control. The City became a crow-bar for lobbyists in Wall Street and around the globe: "If we don't do this, the money will go to London," they would cry; or "we can already do this in London so— why not here?" Its offshore satellites were deregulating even faster, constantly seeking to stay ahead of the others. This race has an unforgiving internal logic: you deregulate—then when someone else catches up with you, you must deregulate some more, to stop the money from running away. For the City, it was a beautiful, self-reinforcing dynamic: The more countries that opened their financial systems, the more business that would float around internationally, ready to be caught in the nearby nodes of the British offshore spiderweb and then sent up to be serviced in the City and its allies on Wall Street.

Not content with all this, the Corporation of London actively promotes international financial deregulation around the globe. With this in mind the Lord Mayor makes 20 or so foreign visits per year.[69] An official report into one such visit to Hong Kong, China, and South Korea in 2007, along with the Lady Mayoress, the Sherriff, and a 40-strong business delegation, gives a flavor of the Corporation's ambition and reach. The delegation's aim, according to the report, was to

> Lobby for China to maintain its course of economic and financial liberalisation, and encourage South Korea to adopt more open policies; Promote London as a global financial center …;
>
> Explain the UK's liberal approach to regulation and corporate governance
>
> Lobby for liberalisation and improved market access in China's banking, insurance and capital markets sectors; including highlighting the restrictive implications of ordinance 10 [which is designed to curb illicit financial flows and requires Chinese government approval for companies to list overseas,[70]] and the benefits of closer engagement with international players.
>
> Encourage South Korea to adopt more liberal policies, notably in legal services, and to follow up on Seoul's ambitions to become a regional financial hub
>
> Explain the UK's liberal approach to trade policy and regulation; and

to encourage a critical mass of similarly thinking countries.[71]

In a meeting with senior officials from Tianjin, the Chinese city chosen as a pilot for national financial reform, the report noted that Mayor Dai Xianglong had "placed great value on deepening cooperation with the City of London, which he dubbed 'the holy place' of international finance and globalisation."

The Corporation of London is a municipal authority for fewer than nine thousand souls and its job is, officially, to promote financial freedom and liberalization around the world. In partnership with the Bank of England, it is one of the most powerful players in global financial regulation today. And almost nobody has noticed it.

Political theorists have had great difficulty even seeing the Corporation of London, let alone appreciating its significance. With its politics of personal proximity, its bonds of shared identity and principle, and its elaborate ceremonials, the City manages to be at once vastly powerful and barely visible. It fits into no modern analytical framework. Mainstream modern publications about the City gloss over its free-floating status.[72] Globalization has led to whole fields of research into the actions and interactions of companies in markets, but they usually only discuss political institutions on an abstract level. Students of the philosopher John Rawls have focused on the social compact—the relationship between rulers and ruled—but have paid relatively little reference to the role of institutions or history. Even Marxists, primed not to worry much about how financial capital organizes itself, have considered the City in the context of a clash between manufacturing capital and financial capital, misunderstanding its true role. The City is, as Glasman puts it, "an ancient and very small intimate relational institution, which doesn't fit into anybody's preconceived paradigm of modernity. Here is a medieval commune representing capital. It just does not compute."[73]

And it was here in the City, just as Britain's imperial dreams collapsed in the ignominy of the Suez retreat, that the financial establishment in London began piecing together the means by which London would restore its position as the capital of a world ruled in the interests of an elite of financial investors. At the moment of its apparent destruction, the British empire had begun to

reinvent itself, back from the dead.

CONSTRUCTION OF A SPIDERWEB
How Britain Built a New Overseas Empire

AS U.S. BANKS ENJOYED THE DELIGHTS OF LONDON'S unregulated markets from the late 1950s and 1960s, the City of London began to see more clearly how the partnership might be expanded more deliberately at a global level. I have already hinted at how the City began to use offshore centers around the world as nodes in a spiderweb, which would catch passing capital by getting rid of taxes and rules and regulations and providing safe, secretive new bolt holes for the world's wealthy, and then send much of the business up to the City. Criminal money, far enough distanced from Britain itself to minimize the stink, would be turned to profit, and other money would accompany it. Meanwhile, the more that countries around the world deregulated and opened their economies to international capital, the more business would be flying around, and the more would come their way. Now I will explore the untold story of how it happened.

As I've noted, when Britain's formal empire collapsed, it did not entirely disappear. Fourteen small island states decided not to become independent and became instead Britain's Overseas Territories, with Britain's Queen as their head of state. It is a status that has been preserved until today. Exactly half of them—Anguilla, Bermuda, the British Virgin Islands, the Cayman Islands, Gibraltar, Montserrat, and the Turks and Caicos Islands—are tax havens, actively supported and managed from Britain and intimately linked with the City of London. Accompanying these were the Crown Dependencies near the British mainland— Jersey and Guernsey, in the English Channel off the French coast; the Isle of Man, near the Irish republic; as well as a scattering of other territories—Hong Kong as a gateway to China, still under British control, and a variety of ex-colonial oddities in the Pacific and elsewhere.

The most important part of the modern British spiderweb, from the point of view of the United States, lies in the Caribbean: the City's gateway to

the vast markets of North and South America. Visit any of these territories and it becomes clear that they are, while half-British, set up to target the United States first of all. Eat out at an outdoor grill or beach restaurant, and your dinner will likely be overshadowed by a giant television screen fixed on a baseball game, and your food may be served by young American waitresses. Each either uses the U.S. dollar as its official currency or has a local currency called "dollar" that is pegged firmly to the greenback.

Offshore finance in the British Caribbean has old roots: Financial interests in Britain and their selected political representatives had learned the basics of tax havenry long before the British empire fell apart.

Organized crime in the United States began to take a serious interest in the U.S. tax code after the mobster Al Capone was convicted of tax evasion in 1931. His associate Meyer Lansky became fascinated with developing schemes to get Mob money out of the United States and bring it back, dry-cleaned. A slick Mafia operator—the inspiration for the figure of Hyman Roth in the film The Godfather—Lansky would beat every criminal charge against him until the day he died in 1983. He once boasted that the Mob activities he was associated with were "bigger than U.S. Steel."

Lansky began with Swiss offshore banking in 1932,[1] perfecting the loan-back technique. This involved first moving money out of the United States—in suitcases stuffed with cash, diamonds, airline tickets, cashier's checks, untraceable bearer shares, or whatever. Next, he would put the money in secret Swiss accounts, perhaps via a Liechtenstein anstalt (an anonymous company with a single secret shareholder). The Swiss bank would loan the money back to a mobster in the United States, who could then deduct the loan interest repayments from his taxable business income there. Lansky opened operations in Cuba, outside the reach of the U.S. tax authorities, where he and his associates built up gambling, racetrack, and drug businesses, becoming what the author Jeffrey Robinson called an "anti-Disneyland . . . the most decadent spot on the planet." Lansky's close ties to Cuba's right-wing leader General Fulgencio Batista helped stoke the violent anger that eventually brought Fidel Castro to power in 1959.

When Castro came to power Lansky moved to Miami, from where he plotted to find his next Cuba, with a pliable tyrant. "It would have to be small and close enough to the U.S. mainland to get tourists and gamblers in and out easily," Robinson explained. "It, too, would have

to come furnished with a thoroughly corrupt political regime, held together by a despot greedy enough to welcome the Mob with open arms; the tyrant would have to be so firmly in place that the political environment would remain stable no matter what. And the Mob's money would have to be spread so thick and wide that, if some other tyrant seized power, he'd need them to maintain his own stability."[2]

The Bahamas, then a British colony, was perfect. Formerly a staging post for British gun-running to the southern U.S. slave states of the Confederacy, and loosely governed for years by laissez-faire members of British high society,[3] the Bahamas were effectively run by an oligarchy of corrupt white merchants.[4] It would quickly become, through Lansky, the top secrecy jurisdiction for North and South American dirty money.

This much is well known. What is not widely publicized is the British authorities' reactions to this burgeoning criminal activity on its territory. A trawl of the archives reveals a curious pattern involving periodic expressions of concern, followed by a seemingly resolute lack of action. A quaint memo from a Mr. W. G. Hulland of the Colonial Office to a Bank of England official in
1961, just as Lansky began major operations in the Bahamas, gives a flavor of such worries. "We feel that this [lack of provision of an effective regulatory system] might be a grave omission, since it is notorious that this particular territory, in common with Bermuda, attracts all sorts of financial wizards, some of whose activities we can well believe should be controlled in the public interest."

London did nothing. Two years later, a "Dear Rickett" memo[5] from M. H. Parsons, a colonial administrator, to Sir Dennis
Rickett, K.C.M.G., C.B., warned that the Bahamas's white, racist[6] finance minister Stafford Sands, who had recently taken a
$1.8 million bribe from Lansky[7] mobsters, wanted to make it a criminal offense to break bank secrecy, and warned that this might annoy the United States. The proposed new legislation "will surely bring protests by the U.S. Government to Her Majesty's Government," Parsons wrote. "We would look pretty feeble if we had to say that we could do nothing to influence the course of

offensive legislation in a territory for which we still have outward responsibility. I admit the point is a ticklish one."

Stafford Sands had estimated that there was a billion dollars or more of dirty money to be tapped by reinforcing bank secrecy, and he was prepared to anger the United States to get it. It was, as the memo put it, "a calculated risk he was prepared to take." London gave the go-ahead, and Lansky built his new criminal empire.

Some locals in the Bahamas were unhappy about what was going on. In 1965 Lynden Pindling, a populist Bahamas politician, threw the ceremonial Speaker's Mace out of a parliament window to a prepared crowd, in a dramatic power-to-the- people gesture. Pindling was elected prime minister in 1967, ending white minority rule, on a platform that had included railing against the gambling, the corruption, and the ruling elites' mob connections, though several accounts say Lansky—astutely assessing the political winds—backed Pindling too.[8] The casinos, the gambling, and above all the Mob-infested offshore industry continued to boom. But when Pindling led the Bahamas to full independence in 1973, skittish offshore players fled in streams. The veteran lawyer Milton Grundy put his finger on what was going on. "It wasn't that Pindling said or did anything to damage the banks," Grundy said.[9] "It was just that he was black."

It so happened that there was a reassuringly British place, just next door to the Bahamas, where the locals were far more friendly, the British were still in control, criminals and bankers were being warmly welcomed, and offshore finance had recently started up: the Cayman Islands. In 1966, when the Caymans' first trust law was written, cows were still wandering through the town center of the capital, George Town, Grand Cayman. The town had one bank, one paved road, and no telephone system. The year afterward, Grand Cayman was connected to the international phone network and the airport was expanded to take jet aircraft. Money began to pour in.

In 1969 a British government team flew to the Cayman Islands to check on progress. The report notes a "frightening absence of certain types of expertise,"[10] adding that "the civil service still reflects in structure and staffing the out-moded pattern of a bygone age."

The report continued, "The flood of private sector activities, progressively drowning basic government functions, has placed an unsupportable burden on senior staff." Flocks of developers were arriving, "usually backed by glossy lay-outs and declaimed by a team of business-men supported by consultants of all sorts. On the other side of

the table—the Administrator and his civil servants. No business expertise, no consultants, no economists, no statisticians, no specialists in any of the fields. Gentlemen vs. Players—with the Gentlemen unskilled in the game and unversed in its rules. It is hardly surprising that the professionals are winning, hands down."

At around this time, the archives show two sets of opinions on Britain's offshore hatchlings starting to emerge within the British Civil Service. On one side sat the British Treasury, and especially its tax collectors, who were virulently opposed to tax havenry and who found the Caymans to be especially obnoxious. The U.S. authorities were getting vexed, too, and in large part because of this the British Foreign Office was broadly opposing havenry, though its position was more nuanced. On the other side of this divide sat the Bank of England, acting as the cheerleader for the new havenry and wishing to see it grow fast—though also trying to make sure that this freewheeling Caribbean offshore expansion did not spin entirely out of control. Supporting the Bank of England, with far less influence, was the British Overseas Development Ministry, which saw offshore finance purely as a trick to get the territories to pay their own way and reduce their demands for British aid without any sign that they had any concern for the inhabitants of developing nations around the world that would suffer vast drains of wealth into the Caribbean sinkholes.[11] Discreetly, within the British establishment, battle lines were drawn. The exchanges were vigorous and at times even acrimonious.

The UK Treasury put together a working party whose report in 1971 said Britain should, in effect, stop encouraging tax havenry in its overseas territories. A worried confidential memorandum from the British Foreign Office in 1973 [12] shares some of the same concern: "The Cayman Islands set up as a tax haven in 1967 and passed appropriate legislation which went considerably beyond what the UK Treasury was prepared to wear." One particularly significant Caymans bill, it noted, had quietly passed into law after an unnamed desk officer had failed, through an "administrative error," to submit the new Cayman legislation to London for consent. The effect of this, the memorandum continued, had been to drive a wedge through the Treasury's carefully constructed defenses against abuse of tax havenry. Britain later patched the holes in its own tax code as best it could, the memorandum notes—leaving, of course, elites in the United States, Latin America, and the rest of the world free to take advantage of the Caymans' offshore facilities. Despite the warning, however, nothing was done.

Further research in the archives, however, reveals something rather more deliberate than a supposed "administrative error" in the construction of the Cayman Islands as one of the world's most important tax havens. A letter from the Bank of England dated April 11, 1969, marked "SECRET," gives us a better sense of the real forces driving the changes.[13] It shows several things.

First, despite Britain's guiding hand, these territories were extremely vulnerable to shady operators—and the smaller such jurisdictions are, the easier it is for their local administrations to be captured by unaccountable financial interests based elsewhere. "The smaller, less sophisticated and remote islands are receiving almost constant attention and blandishments from expatriate operators who aspire to turn them into their own private empires," the Bank letter notes. "The administrations in these paces find it difficult to understand what is involved and to resist tempting offers." The Bank of England letter had identified something generic to offshore centers: They are small states captured by large foreign financial, and often criminal, interests. "We need to be quite sure that the possible proliferation of trust companies, banks, etc., which in most cases would be no more than brass plates manipulating assets outside the Islands, does not get out of hand."

But the Bank of England's concerns did not reflect ethical qualms about the harm these places were wreaking on other countries—the Bank was simply expressing its desire to retain power to influence events, and particularly to safeguard the Sterling Area, the British-linked currency zone that had included most British colonies and dominions and whose members enjoyed relative freedom of payments inside the zone but which were strictly constrained from letting capital flow outside the Sterling Area. Attracting foreign dirty money, by contrast, was keenly appreciated by the Bank. "There is of course no objection to their providing bolt-holes for non-residents," the letter continued, "but we need to be sure that in so doing opportunities are not created for the transfer of UK capital to the non-Sterling Area outside UK rules." In other words: no objections to looting the treasuries of the United States and sucking illicit financial flows out of Latin America—just so long as Britain's tax base and its postimperial financial network was protected. Any harm being inflicted on other countries was deliberately to be ignored.

As time went on, however, the Bank became increasingly worried that these Wild West British offshore centers were becoming weak points in the Sterling Area, allowing leakage outside the zone. In 1972, under the Bank's guidance, Britain shrank its Sterling Area to cover

only Britain and Ireland and the Crown Dependencies, excluding the new tax havens. The Cayman Islands, for its part, adopted the Cayman dollar as its new currency, at par with the U.S. dollar, and two years later this

was de-valued to 1.20 Caymanian dollars to the U.S. dollar—where it has remained ever since.

In the same year that the Sterling Area was shrunk, the officials who were trying to stop the tax havenry suddenly disappeared from the archive files. Taking their place was a new group of officials who seemed to be unaware of the 1971 report warning about the dangers of tax haven activities. They realized that the contraction of the Sterling Area hadn't solved the problem at all. In 1977 the new group appears to have rediscovered, still sitting on a shelf, unimplemented, the 1971 report warning about tax havenry. Again nothing was done. It looks to have been like institutional Ground-hog Day within the UK Civil Service: Reports were written, memos were drafted—and nothing changed. History had repeated itself within and between the departments, all in a matter of less than ten years.[14] Each time, we find the Bank of England officials working hard to fight the tax havens' corner.

At the same time, the representative of the Overseas Development Ministry, clearly supporting the Bank of England's line, seems to have been concerned almost exclusively with the ten thousand Cayman Islanders, apparently entirely blinkered to the terrible impact this may be having on, say, the several hundred million victims of capital flight in nearby Latin America. Whatever its motivations—hopeless myopia, or a cynical attempt to privilege its own dependent territories at the expense of the rest of the developing world—the development ministry ends up stoutly defending the legislation of places like the Cayman Islands, legislation designed specifically to undermine the tax authorities and economies of developing nations around the world.

A comment from a Caymanian lawyer in the 1970s highlights where the main beneficiaries of all these illicit financial flows were. His clients, he said, would periodically contact him, worrying about Fidel Castro's Cuba nearby and insisting on special clauses to compensate them should Castro invade. "I have to explain that Castro wouldn't find any [money] in the safe," he said; "they're all really held in New York or London."

A long letter in 1971 from Kenneth Crook, the newly arrived British governor of the Cayman Islands, provides a little more detail on the thinking in London in those days and on Britain's behind-the-scenes controlling role. "You, sir, and the office as a whole," he wrote in his first long report back to his superiors in London, "might find some interest in the first reactions of a pair of Diplomatic Service eyes and ears (two pairs, if you count my wife's) to this basically colonial situation."

Then, as today, His Excellency the Governor, whom the British Queen appoints on the British government's advice, was the most powerful person on the island, presiding over a cabinet of local Caymanians. They do have elections in Cayman, with revved-up political rallies and all the fun of the fair—but the governor sent from London remains responsible for defense, internal security, and foreign relations; he appoints the attorney general, the judiciary, and a number of other senior public officials. The final appeal court is the Privy Council in London. Caymanian dollar notes carry the British Queen's head, and the national anthem is "God Save the Queen."

Governor Crook was running a place with just ten thousand inhabitants: a large, part-English village. A Time magazine reporter in George Town, Grand Cayman, at around the same time advised readers that if you did not have the proper cab fare, your driver would tell you not to worry—you could just pay him the next time you happen to see him. A history published in the Cayman Financial Reviewclaims that mosquitoes would swarm densely enough to suffocate cows.

"This is no tropical paradise," Crook continued.

> I could enlarge, in terms of a magnificent but mosquito-ridden beach; of a fairly new but rather ill-designed and sadly-neglected house; of a pleasant but very untidy little town; of swamp clearance schemes which generate smells strong enough to kill a horse; of an office which will one day ere long collapse in a shower of termite-ridden dust.
>
> This is certainly an odd appointment for a Diplomatic Service Officer. How many of my colleagues, like myself, contemplating the inanities of some Head of State, have said to themselves "If only the fool would do so and so, how easy it would be." But have they really thought how it feels to be the fool in question? . . . I might invite my colleagues to try running a Parliament in the best Westminster tradition, in which one Member leaves, and as a result throws the entire Finance Committee into confusion for want of a quorum, because he has to drive the school bus—which he owns.
>
> Sir, I hope I may be forgiven if underlying this despatch so far is a note of perhaps unbecoming levity.

The governor's long letter yields a picture of an amiable and decent enough upper-class British colonial type, trying his best to understand

and cope in a strange, fast-moving new environment. In a speech in 1973, Crook told banks to remember that they were not the island's only inhabitants: People lived there too. "If you don't think about that," he said, "you might as well buy an aircraft carrier and operate from that."[15]

But on politics, and the strange relationship between Britain and its little quasi-colony, his tone hardens. "Caymanians don't want independence," Crook wrote. "They don't want internal self-government either—they are very unwilling to trust each other with effective power . . . hence they are delighted to have a Governor around; apart from anything else he's very handy for taking unpopular decisions."

Governor Crook also put his finger on a crucial subtlety of the relationship that underpins the entire edifice of offshore finance: the fact that Britain has effective control, while pretending not to be in control. "They realise that if the Governor is seen to have effective power then the others appear to be essentially cyphers. The elected politicians among them find this bad for their image," Crook wrote. "What they want is to make the Constitution look as if it obliges the Governor to do what they want, even though they know it doesn't. I think we are in the world of semantics here. The more Caymanians we can put in positions of power, the better; they will act as lightning conductors for political dissent."

Very little of substance has changed since then, as a senior Caymanian politician, who asked not to be quoted, explained to me on a visit in 2009. "The UK wants to have a significant degree of control over the jurisdiction, but at the same time it does not want to be seen to have that control," he said. "Like any boss, it wants influence without responsibility; they can turn around when things go wrong and say 'it's all your fault'—but in the meantime they are pulling all the strings. The governor can bring an agent of the crown to come here and do whatever they want," he said. "The hand has always been behind the scenes, in the shadows: it has not shown its face." Keeping the reality hidden from Caymanians is, he said, part of political leadership. "It is like having children . . . it is not necessary to tell them all the burdens and challenges you face. Eighty percent of the masses who turn up at our meetings believe they have control."

The gesture toward elected representation given to Cayman voters, plus all the money, keeps the locals happy, and Caymanians solidly support the link with Britain today. Roy Bodden, a former minister and author of a history of the Cayman Islands, remembers the Falklands War between Britain and Argentina in 1982, when influential Caymanians, not content with having helped Argentinian generals and

their wealthy friends loot their country, launched a “Mother Needs Your Help” fund. Collection tins were rattled in the street, and a million dollars raised, he said, then simply handed over to Britain for the war effort.[16]

Crucially, this remarkable degree of local support for the British connection reassures international finance that locals will not

rock the boat and disturb the business of making money. But the true bedrock of this financial center is Britain's controlling role.
If the islands became fully independent and were handed fully over to dark-skinned Caymanians, most of the money would flee.

Something else turned up in the archives too. Dated February 23, 1969, it is a cutting from the Sunday Times, written by its financial editor Charles Raw. While it is not unusual to find newspaper clippings in archive files, the presence of this particular one—closing the file, and with no attendant commentary—is intriguing. Might it have been left as a marker for historians? Something that couldn't make it into official documentation or be stated explicitly? The name of the clipping is at the least suggestive: "Why Not Turn the City into a Tax Haven?"

Raw's article, written amid one of the great boom phases of the offshore Eurodollar markets in London, is a piece of unashamed cheerleading for the City. It derides a "notorious" section of the UK tax code that gives tax collectors useful powers to curb offshore leakage, and it says London should let nonresidents get tax-free treatment for certain kinds of funds. "Most of the authorities' energies over the past few years have been devoted to stopping money going out," Raw wrote. "But perhaps it would be more rewarding to pay greater attention to money coming in." As we will see in the next chapter, similar lines of thinking were emerging in the United States.

The same Times article contains another oddity. It begins by praising a Geneva-based mutual fund group called Investors Overseas Services (IOS), which Raw says "has done wonders for the U.S. balance of payments by pumping the world's savings into U.S. shares." The article goes on to tout a new Bermuda-based fund that would "like to do the same for the UK balance of payments."

IOS, however, was no ordinary company. Raw went on to write a book about it, the title of which, Do You Sincerely Want to Be Rich?, was the line that IOS salesmen pitched around Europe, door-to-door, as they vacuumed up retail investments to channel into offshore funds. The company's founder, Bernie Cornfeld, called it "people's capitalism," and for a short time he made IOS into one of the largest foreign institutional investors on the U.S. stock exchange. His board of directors included a former governor of California, Pat Brown, and FDR's son James Roosevelt, and many of his advisers came from the Bank of England.[17]

Cornfeld bought castles in France, sailed a forty-two-foot Corsair, and drove a Lancia Flaminia convertible. He dated the Dallas soap opera star Victoria Principal and the Hollywood madam Heidi Fleiss, and his company bought banks in the Bahamas, Luxembourg, and Switzerland. "I had mansions all over the world. I threw extravagant parties," he said. "And I lived with ten or twelve girls at a time."[18]

Cornfeld had originally left the United States "looking for a less competitive market," as one obituary put it, and his company's fragmented national identity—it was incorporated in Panama and headquartered in Switzerland—was the key to its success: No regulator or criminal prosecutor, he hoped, would be able to tie it down. It was a quintessentially offshore company. The U.S. tax authorities considered it European, and others considered it American. When the authorities in France became suspicious of IOS, Cornfeld hopped to Switzerland, where he teamed up with the same secretive bank in Geneva that the mobster Meyer Lansky had been using to deposit the skim from his casinos.

At first, Cornfeld took deposits mostly from U.S. military personnel stationed in Germany. He soon began looking further afield: first targeting an estimated 2.5 million U.S. expatriates around the world, then the British postimperial expatriate networks, then traders in Hong Kong, settlers in Kenya, French rubber-planters in Laos and Vietnam, Belgian miners in Congo, the Lebanese in West Africa, the overseas Chinese, and so on. He took money with no questions asked and an assurance that depositors' secrets would be safe. When he bought his first airline, a joke went around inside IOS that he was starting up "Capital Flight Airlines," and its couriers, according to Tom Naylor's book Hot Money, spirited huge sums out of developing countries. "As civil war raged in Nigeria and international relief for the traumatised civilian population rolled in, " Naylor wrote, "IOS was on the scene to help: the international aid funds often wound up in the safe in Geneva." Even bigger sums were being bled from Latin America.

This, remember, is the company that was being held up as a model for turning the City of London into a tax haven. Even worse, by the time Raw's article emerged, IOS was already enmeshed in high-profile scandals, including illegal operations discovered in a Brazilian police raid in 1966 and a high-profile Life magazine exposé of a joint IOS-Lansky courier operation in
1967. What was
Raw thinking?

Naylor notes another curiosity about illegal offshore money, of which Cornfeld's story is a perfect example. Banks take in deposits (which are liabilities of the bank) and make loans (which are its assets), but they also hold capital, which is the safety buffer that investors put in. If loans go bad this capital serves as a shock absorber: It is the investor capital, not the deposits, that take the hit (though if more and more loans go bad and the capital is exhausted, then the bank runs into real trouble, as happened to banks in the latest financial crisis). Prudent bankers will restrict their loans up to a multiple of, say, ten times the capital buffer.

Capital is far more valuable to bankers than deposits: The more capital you have, the more you may multiply your balance sheet. And this helps us understand why banks like secret offshore deposits so much. Investigators who probed IOS said it operated under an assumption that 10 to 20 percent of its deposits were, effectively, permanent capital—that is, the owners could not withdraw it, either because it was too risky for them to do so or because they were dead. It is no wonder that Swiss bankers were so reluctant to hand over the deposits of Jews who died in Hitler's concentration camps: The deposits had essentially, the Swiss believed, become permanent reserves of bank capital. Not only that, but depositors willingly accept below-market interest rates in exchange for secrecy—boosting the profits to offshore banking.

By 1970 Cornfeld's IOS was tottering under ever more scandals. Some of IOS's Swiss employees had started complaining that Cornfeld owed them money, and an insider accountant, quietly picking through IOS's international labyrinth, realized that it was a house of cards. The company fell into the hands of a big-time criminal named Robert Vesco, whom one partner called "a sonofabitch who hurt, denigrated or corrupted everyone he had contact with." Another associate said Vesco "could talk you right out of your socks, or blast you out of them, or you would find somebody else owned your socks." Vesco had been a major supporter of the Bahamian leader Lynden Pindling but was forced out in 1973 under U.S. pressure after he was found to have secretly donated $200,000 to Richard Nixon's Committee to Re-Elect the President (CREEP), partially financing the Watergate burglary.

Although the official archives paint this picture of divisions between Britain's various departments over their sponsorship of the

growth of the British offshore zone, veterans in the Cayman Islands saw things from a very different angle. Under Britain's benign, hands-off approach to government, offshore lawyers were constructing the new offshore system.

One of the very earliest practitioners was Casey Gill, an ethnic Indian lawyer, author of a book about the Cayman Islands' offshore attractions, and one of the first to arrive at the start of the boom times.[19] "It was a slow, sleepy fishing village," Gill remembered. "The town ended just a half mile up there," he said, gesturing toward a window. "No buildings, just wooden shacks—apart from the Barclays building." In those early years, he reminisced, tax and accounting experts would arrive from around the world to give seminars, helping the Caymans to shape their laws accordingly. "They would come and say, 'These are the loopholes in our system.' Someone would say, 'We are competing with, say, Liechtenstein.' Or in those days the Bahamas was still trying to come through. Panama was there, and Switzerland." With each new piece of information from outside, the Cayman-based lawyers, bankers, and accountants got to work targeting the gaps and addressing the competitive threats from elsewhere.

"There was also the Red Threat: the Russians," continued Gill. "Investors were seeing shadows and ghosts everywhere. We had Castro clauses: If any government tries to expropriate assets, it would turn out they were simultaneously domiciled somewhere else." Many of these assets came out of Latin America. William Walker, a veteran father of the Cayman financial sector, described how the assets were handled in an interview to a visiting journalist in 1982. Most of the fourteen hundred registered companies whose names festooned the walls outside his office, Walker said, "don't require too much work—just signing occasional documents and perhaps holding two meetings a year. We funnel a lot of money from Central and South America.… Most of the money coming out of Latin America, of course, is in breach of their governments' exchange control regulations."

Gill said he was a founder member of a body called the Private Sector Consultative Committee—an association representing every branch of the burgeoning financial sector: trust practitioners, accountants, bankers, lawyers, and so on. Any government legislation that impacted on the Caymans' role as a tax haven would go through this committee. "The government has a legal draftsman. We would meet them—he would go and prepare a draft and circulate it back to us. We would

come back with suggestions, it would be redrafted and circulated to the PCSS, it would get the OK, then the government would pass it into law. The governor would send it to the Foreign and Commonwealth Office (FCO)—and they would say 'no problem.' Usually business would say 'this is what we want' and the FCO would let you do what you want to do."

I asked Gill if Britain ever said no or raised objections to the new legislation. "No. Not ever. Never." He then qualified those last words a little: There had been a case, "eight or nine years" before, when the legislation had been delayed somewhat. But his basic point was clear. While the gentlemen in London buzzed around like irritable wasps, arguing with each other and writing reports on the offshore phenomenon, the wizards of global finance—not to mention half the world's criminals—were forging their own private Caribbean domains, almost entirely free from outside interference, and under Britain's protection. And so the offshore industry grew.

As an aside, it is worth noting what happens when, for example, the Caymans hatches up a new and ingenious offshore loophole targeting U.S. tax laws or financial regulations. The United States will learn about it sooner or later and take counter measures—and so the Caymans will create new loopholes to get around those. As this battle continues, America's tax code and financial regulations grow ever more complex. Offshore rebounds back onshore, in a constant dance of ever-deepening complexity. The confusions that result create, in turn, yet more opportunities for the wealthy and their advisers to find pathways through the expanding legal thickets. Huge, costly industries grow up to service the avoidance industry.

That is not all. The U.S. tax authorities often find defenses against some of the impacts of the worst offshore schemes. Yet a developing country, blind and inexperienced to the ever-deepening offshore complexity, is all but defenseless. As it slips further behind in the battle, its elites enjoy ever more opportunities for abuse, and local politics, and people's faith in their own rulers, rot a little bit further. As this happens, the message from George Town remains the same: "Not our problem. Fix it yourselves."

One of the more dramatic milestones in this ongoing dance between offshore center and onshore regulator came in 1976 when Anthony Field, the managing director of Castle Bank and Trust (Cayman) Ltd., was served with a subpoena upon arriving at the Miami airport, on suspicion that his bank was facilitating tax evasion by U.S. citizens. They wanted him to testify before a grand jury, but he refused.[20] Fearing that Field would spill his clients' secrets, exposing the Caymans to a major

international scandal, an oppressive new secrecy law was drafted, the now infamous Confidential Relationships (Preservation) Law, making it a crime punishable by prison[21] to reveal financial or banking arrangements in the Caymans. You can go to jail not only for revealing information but just for asking for it.

It was a giant, fist-pumping "fuck you" aimed squarely at U.S. law enforcement, and it has become a cornerstone of the Caymans' success until the present day.

When the confidentiality law was enacted, Cayman practitioners remember cash literally flying in on private aircraft. "Money was still coming in large suitcases," explained Chris Johnson, a veteran accountant. "People arriving with large amounts of money would get a police escort from the airport to the bank if they requested it." It was happening all across the Caribbean. By the early 1980s, the Colombian Medellin cartel kingpin Carlos Lehder was smuggling industrial quantities of cocaine into the United States from Norman's Cay in the Bahamas, having turned it into an ultimate male libertarian fantasy. One former Medellin cartel pilot remembers being picked up by naked women at the airport. "It was a Sodom and Gomorrah," he said. "Drugs, sex, no police . . . you made the rules."[22] Lehder's goons played hide-and-seek with the U.S. Coast Guard across Biscayne Bay, landing planes on U.S. interstate highways and leaving bodies strewn across Florida. As the cocaine flooded into the United States, money flew out again, in shrink-wrapped bills loaded on wooden pallets; the Cayman Islands monetary authority would then return it to the Federal Reserve. How, the Fed asked, could this tiny island selling trinkets to cruise ships send them such a torrent of money?

The drugs money was, at least, saving Britain's development ministry tens of thousands of dollars in foreign aid. The authorities in the Caymans simply denied there was a problem and wheeled out the old offshore favorite: The scandals merely represented a case of bad apples, and the system had been cleaned up thoroughly ever since. When the next scandal came, the official response would always be the same.

Johnson remembers being involved in one bank audit where his company pointed out questionable activities, which the government simply ignored. "That, coupled with the leather-clad hot-panted secretarial staff strutting through the deep pile carpets in high heels, might also have been construed as a red flag," he said. The bank failed

two years later.

The fiascos, he added wearily in an interview in 2009 in his George Town offices, have just kept repeating themselves ever since. He continues to bump up against the confidentiality law today. “One problem we have in trying to recover the assets is

that we don't even know who the directors are…. As a liquidator, I am following the money. If I want to negotiate with a director I have no way, no clue. If I go and ask someone, 'Are you sitting on half a million dollars of my money?' that's breaking the law, and the penalty is jail. It is preposterous that these directors, some of whom sit on the boards of more than a hundred companies—one sits on over 450 boards of directors—are charging fees of up to £20,000 a company." The confidentiality law, he added mirthlessly, should be shredded.

Johnson also pointed to something else. Company law statutes in the Caymans date back to English law as far as 1862— with certain democratic provisions removed. One of these carve-outs means that directors of hedge funds or mutual funds are often indemnified from litigation. "So you can't be sued for negligence. Suppose I'm liquidating a fund and $200 million is gone. Why shouldn't I be able to sue them? The directors are steering the ship, but when it sinks they can't be sued." Other sources indicate that the companies that provide directors owe no duty of care to the company or its creditors to ensure that the directors they provide perform their functions properly.[23] No wonder directors and companies—not to mention fraudsters—love the Cayman Islands. And no wonder so many Cayman vehicles have come to so much grief in the latest financial crisis, as we shall see.

The era of suitcases of drug money flooding into the Caymans is pretty much over today. U.S. authorities began to ratchet up the pressure during the drug war, plugging some of the worst leaks. The lawyer Jack Blum explained what happened next on the Cayman Islands: "They say, 'We don't do that now.' Each time they were exposed, they would clean up the thing that was exposed. They'd say things like, 'We're in financial deals now; we're in insurance.' You go back to Cayman today, and all the guys are in pinstripe suits."

And yet the crime continues, in different, more sophisticated guises. In March 2001, the U.S. Senate Permanent Subcommittee on Investigations took testimony from a U.S. owner of a Cayman Island offshore bank who estimated that 100 percent of his clients were engaged in tax evasion and 95 percent were U.S. citizens. Dig beneath the Cayman Islands' sunny spin today, and the incentives to mischief are easy to find. "Client privacy," a government website notes, [24] "is protected by the fact that the Registrar of Companies can only release the name and type of company, its date of registration, the address of the registered office and the company's status." You cannot find a list of directors of companies in Cayman, or even a charter that describes what

a company is about, without going through a court battle. Trusts do not have to be registered—and there lies another very large and murky tale. The form and the context has changed, for sure, but at root Cayman still does what it always did: finds clever new ways to undermine the rules and laws of other nation-states.

As Britain set up its Caribbean offshore networks, it was doing something else far closer to the British mainland, in the crown dependencies of Jersey, Guernsey, and the Isle of Man. While the Caribbean havens project the City of London's global reach to cover the North and Latin American markets, the Crown Dependencies are focused on Europe. Still, U.S. businesses are highly active here. The U.S. Government Accountability Office in 2008 listed Caribbean subsidiaries of Citigroup, American Express, Bank of America, Goldman Sachs, Morgan Stanley, JP Morgan, and Wachovia, among others. Most are in Jersey and involve private wealth management services for U.S. citizens in Europe, derivatives businesses, private equity, tax avoidance, and cash management. JP Morgan alone manages well over $100 billion worth of business out of Jersey just for private equity and real estate funds. Average annual bank deposits in Jersey in 2007 were over $500,000 per person, compared with less than $30,000 in the United States.

As with the Cayman Islands and other Overseas Territories, the Crown Dependencies have an ambiguous, half-in, half-out relationship with Britain that allows them to retain a controlling hand and say, "There is nothing we can do" when somebody complains. Britain handles Jersey's foreign relations and defense, and his Excellency the lieutenant governor represents the Queen; Jersey financial regulation goes up for approval to the venerable Privy Council in London. Jersey is outside the European Union, though it cherry-picks the European laws it likes and discards the rest.

John Christensen, Jersey's economic adviser from 1987 to 1998 and now a fierce critic of its tax haven status, remembers that when Britain got embarrassed about something Jersey was doing, its civil servants would engage in a kind of theater, to get things to change but without being seen to force Jersey to change. "A lot happens around winks and nods," he said. "They would say, 'This is all a bit of a bother, but the Europeans are putting pressure on us and we don't want to put

ourselves in a position where we are required to make you do this.' Forcing Jersey to do something would reveal that Britain has the power to make Jersey change—we all knew it. These are highly intelligent people and these things don't need to be said."

Though Jersey feels exceedingly British, this facade hides an alien political system in which medieval politics combines with futuristic, high-speed offshore finance. There are no political parties, and the government is absolutely captured by global financial services. This ambiguous relationship with Britain dates back centuries. When the Prince of Wales fled via Jersey into exile in France in 1649, he was given refuge by George Carteret, a major landowner. Later the prince became King Charles II and gave Carteret a large tract of land in North America, known today as New Jersey. The original Jersey became a refuge and hothouse for European radicals, many of whom had fled first to England to escape persecution, then were shuffled off to this strange quasi-English place, partly to provide the plausible deniability that enabled Queen Victoria to avoid embarrassment in front of her various cousins in France, Belgium, Russia, Hungary, and beyond. Karl Marx and Friedrich Engels were regular visitors. In the twentieth century, officials returning from the colonies brought new colonial connections to help Jersey bankers build networks in Africa, the Middle East, and the Far East. People either moved to Jersey or kept their money there, in a trusted British environment where they could bank secretly and avoid tax. Expatriates who did not declare their income to their countries of residence, often poverty-racked African nations, knew they would never be caught.

It was not only poor countries suffering, of course. Britain's own taxpayers were too. A letter sent in 1975 to Tony Benn, a well-known British member of parliament, describes the cynicism. "I am somewhat surprised to see a Mr. Gent from the Bank of England giving advice on how to avoid paying tax—I wonder if this is really part of the Bank of England's duties?" Mr. Gent, Benn continues, "suggests that the Bank of England will not be prepared to pass on information required by the Inland Revenue! Does the UK Treasury have no control over the Bank of England? Surely Bank employees should not be working against Government Policy? And just what sort of arrangements and deals are made at these events 'behind the scenes'? It really is just a bit too sordid to be true."[25]

Martyn Scriven, secretary to the Jersey Bankers' Association, illustrated how Jersey's network grew over time.[26] He ran the

Barclays operation in Jersey, which he said catered to about one hundred thousand British expatriates. Smaller packets—up to £25,000, say—were saved in the clearing banks, while bigger packets went into the more secretive trust companies. “The biggest business developer is client recommendation,” said Scriven. “The client will say, ‘I’m happy, and I’d like to introduce you

to my friend'—and you build it up like that. You get some seriously interesting people . . . someone who goes abroad as a rigger twenty years ago for Shell may now be in charge of the company's West Africa operations." It seems reasonable, too, to imagine how client recommendation might one day deliver Nigeria's oil minister and his friends, say, or a powerful Indian businessman, or a South African casino operator. The network grows, following old colonial links. "We gather deposits from wealthy folk all around the world, and the bulk of those deposits are sent to London," Scriven continued. "The banks consolidate their balances every day, and surplus funds won't sit here—they either go to another bank or on and through to the City. If I have money to spare, I pass it to the father. Great dollops of money go into London from here." In the second quarter of 2009, the UK received net financing of $332.5 billion just from its three crown dependencies.[27]

Jersey Finance promotional literature makes a similar point. "Jersey," it says, "represents an extension of the City of Londo n."[28]

As the City of London's Caribbean havens and its crown dependencies were developing, something similar was happening in Asia. Hong Kong, which the U.S. economist Milton Friedman called the world's greatest experiment in laissez-faire capitalism, was to be the new Asian offshore jewel, a tax haven gateway to China and the subregion. Britain remained the guiding hand, while giving financiers free rein. The colony's financial secretary, Sir John Cowperthwaite, installed in 1961, had such stridently antigovernment views that he curtailed the publication of official statistics on the grounds that it would help the civil servants. When China introduced its "Open Door" policy of market reforms in 1978, opening up to foreign investment and export industries, Hong Kong was made: It was, as the financial crimes fighter Jack Blum remembered, "an 'anything goes, no- regulation' world." When Britain handed it back in 1997 China kept it as a "special administrative zone" with the same ambiguous offshore status. Hong Kong's Basic Law states that it shall "enjoy a high degree of autonomy" from China in all matters except foreign relations and defense. The close resemblance here with the British offshore arrangements is no coincidence. Chinese

elites wanted their own offshore center, complete with political control and judicial separation. “Corporations doing business in China set up Hong Kong companies with secret shareholdings,” Blum continued. “Today Hong Kong is where most of the corruption in China is accomplished.” When the G20 countries sought to approve a tax haven blacklist at a summit meeting in April 2009, Chinese premier Hu Jintao fought intransigently with Barack Obama to get Hong Kong and Macau, another notorious Asian offshore hub, excluded. He got them relegated to a footnote.

Despite Chinese control, the City of London remains deeply engaged with Hong Kong, as do Wall Street firms—often through their London offices. Hong Kong remains a smallish offshore player: Its nonresident deposits, at $149 billion in 2007, were just one-eleventh the size of the Cayman Islands’ $1.7 trillion. One day many years hence, however, it may grow large enough to become a key financial tool in Chinese global imperial strategies.[29]

Singapore set up its financial center in 1968 and soon began to attract hot money.[30] Andy Xie, Morgan Stanley’s star Asia economist, described how it had turned out, in an internal email in 2006. “Singapore’s success came mainly from being the money-laundering centre for corrupt Indonesian businessmen and government officials,” he said. “To sustain its economy, Singapore is building casinos to attract corruption money from China.”[31] Xie and two colleagues reportedly had to resign after the email became public.

By the 1980s, the main elements of the City of London’s offshore networks were largely in place and being used extensively by Wall Street. But by then the United States, long a victim of offshore erosion, was in the process of turning itself into the world’s biggest secrecy jurisdiction.

THE FALL OF AMERICA
How the United States Learned to Stop Worrying and Love the Offshore World

EARLY IN 1966 A YOUNG ECONOMIST WORKING at the New York headquarters of Chase Manhattan Bank was riding a company elevator when a former State Department operative handed him a memo. It isn't clear if Chase management knew of the memo: This came from Washington, not from Chase. But the young economist, Michael Hudson, was astonished by its contents.

Hudson had gotten into banking by chance: After studying economics at New York University in 1960 he took a job in real estate banking, and later, when an opening came up at Chase to look at what are called balance-of-payments issues, he was the only applicant. Now a respected (if controversial) American economic commentator, Hudson said his time at Chase— during which, incidentally, he fired a "nasty little twit" called Alan Greenspan[1]—taught him most of what he ever learned about international economics.

In those days Chase was the oil companies' preferred bank, and it had asked Hudson to study the petroleum industry's impact on the U.S. balance of payments to provide ammunition that would help the oil companies claim they were "good for America" and help them lobby for special government perks. One of his tasks on this project was to find out where the oil companies made their profits. At the producing end? At the refineries? In the gas stations? David Rockefeller, Chase's president, arranged for Hudson to meet Jack Bennett, Treasurer of Standard Oil of New Jersey, now part of the ExxonMobil empire.

Bennett gave him his answer. "The profits are made right here in my office," the oilman said. "Wherever I decide."

He was talking about transfer pricing, the practice I explained in chapter 1, where banana companies trailed their accounts around the

world's tax havens in order to shift paper profits into the low-tax countries and the costs into the high-tax countries. Bennett showed Hudson exactly how large, vertically integrated multinationals could shift profits around the globe, apparently without breaking the law. The company would sell its crude oil cheap to a shipping affiliate registered in zero-tax Panama or Liberia, which in turn sold it on at a high, nearly retail price to its refineries and marketing outlets. In the high-tax countries where the oil is produced and consumed, the subsidiaries buy at a high price and sell cheap, so they are unprofitable and pay little tax. But in the middle, in zero-tax Panama or Liberia, the subsidiaries buy cheap and sell dear, making vast profits. But these havens levy no tax on those profits.[2]

To this day, accounting standards effectively hide this kind of trickery, letting companies shovel results from different countries into a single category (often called simply "international") that cannot be unpicked to work out who takes what profit where. "Only the immense political power of these extractive sectors," said Hudson, "could have induced their governments to remain so passive in the face of the fiscal drain."

This kind of offshore leakage was relatively restrained in the 1960s if compared to today. Capital flows were strongly regulated, taxes were high, and the offshore system, though alive, was still a fairly modest phenomenon, and the British offshore spiderweb was in its infancy. With the golden age of capitalism in full swing, American households, and particularly the poorest, were seeing tremendous improvements in wealth and welfare; Germans were basking in their Wirtschaftswunder; France was in the midst of its Trente Glorieuses; Italy was installing the springboard for its Il Sorprasso moment, to come twenty years later, when its economy would outgrow Britain's; and Japan was unleashing its own economic miracle. In large swaths of the developing world, infant mortality was falling, economies were growing, unemployment was tumbling, and hungry children were finding food regularly on their dinner tables.

Although change was coming, the United States still harbored major and powerful opponents of the offshore system. After the Great Depression, Wall Street, diluted in a large and diversified industrial economy, had relatively little political clout to veto progressive New Deal–style legislation. By contrast, the City of London's position at the center of the globe-spanning British empire gave it the domestic political heft to sabotage any British version of the New Deal. Not only that, but British finance hadn't been so directly implicated in the

excesses of the 1920s. London was perfectly placed to provide American banks with an escape route from regulation at home. They could rebuild their powers offshore.

The brief memo passed to Hudson in the elevator suggested, however, that some Americans were hoping to transform the U.S. approach to the offshore world.

"Like Switzerland, flight money probably flows to the US from every country in the world," the memo started. But then the complaints began. The United States was not following the Swiss lead aggressively enough, it said. "US-based and US- controlled entities are badly penalized in competing for flight money with the Swiss or other foreign flight money centers." One reason the United States lagged in the quest for dirty money, it argued, was "the demonstrated ability of the US Treasury, Justice Department, CIA, and FBI to subpoena client records, attach client accounts, and force testimony from US officers of US-controlled entities, with proper US court back-up." There were also American taxes, plus risks associated with the Cold War and a view among "sophisticated" foreigners that U.S. money managers were "naïve and inexperienced in manipulation of foreign funds."[3] It also criticized investment and brokerage restraints "which limit the flexibility and secrecy of investment activity."

The message was unequivocal and strong. America ought to turn itself into a tax haven.

"They were saying 'We want to replace Switzerland. All this money will come here if we make this the criminal center of the world. This is how we fund Vietnam,'" Hudson remembers. "We wanted foreign criminal money, which was patriotic, but not the American criminal money." The operative in the elevator suggested to Hudson that he might find out how much foreign illicit money the United States might be able to get.

Fast forward 40 years, and it is clear that the wishes of whoever wrote that memo have been realized. A table in Raymond

Baker's 2005 book Capitalism's Achilles Heel outlines just how far the United States has fallen. By then, it showed, U.S. banks were free to receive the proceeds from a long list of crimes committed outside the country, including alien smuggling, racketeering, peonage, and slavery.[4] Profiting from these crimes is legal, just so long as the crime itself happens offshore. A few of these loopholes have now been closed, and U.S. law addresses some of the others, though often only in tangential, incomplete ways. But it remains true that a U.S. bank can knowingly receive the proceeds of a wide range of foreign crimes, such as handling stolen property generated offshore. The United States is wide open for dirty money, just as that Hudson memo
anticip
ated.

Tax havenry has always been contested in the United States. Only a month after coming to power in 1961, President Kennedy called for an end to the abuse of "foreign tax havens" and, as noted in chapter 1, asked Congress for legislation to "drive them out of existence." Barack Obama's cosponsorship of the Stop Tax Haven Abuse Act just before he came to power, and the subsequent evisceration of the act by offshore lobbyists, is merely a recent skirmish in an old war.

The United States, like most countries, already had some tax haven characteristics long before the day in 1966 that Michael Hudson stepped into that Chase elevator. From 1921 the United States has let foreigners deposit money with American banks and receive interest tax-free as long as it isn't connected with a U.S. business.[5] And Wall Street had ensured that the United States wasn't going to tell foreign governments about their citizens' holdings, despite the best efforts of John Maynard Keynes and his U.S. counterpart Harry Dexter White to combat capital flight with financial transparency.

When president John F. Kennedy launched his "Alliance for Progress" with Latin America in 1961—"a vast cooperative effort, unparalleled in magnitude and nobility of purpose," as he put it—he said he hoped to coax Latin Americans into repatriating all the money they had stashed in U.S. banks in order to reinvest it at home. Latin American leaders quickly pointed out that this would not happen unless the United States amended its tax laws, which promoted secret banking. Substantial pockets of secretly held foreign wealth already existed, not just on Wall

Street but elsewhere too: in Texas, for example, but also most especially in the Southern District of Florida.

Just as Latin Americans used the United States as a home for tax evasion, immigrant communities in the United States, and especially first-generation Americans, were major U.S. tax evaders. “For various cultural reasons they didn’t trust anyone—so they put it offshore,” said Mike Flowers, a former U.S. Senate staffer. In addition to the first-generation Latin Americans who live across the nation, Flowers described the large concentrations of first-generation Iranians and Russians in California, “New Asians” on the West Coast, Jewish communities in various locations, and so on. “They tend to come clean after they have kids and have been here a while,” he continued. “They get settled and then they think, ‘Oh my God, I have all this offshore money and what do I do now? If I get caught, I’m screwed.’”

In an article entitled “Miami, the Capital of Latin America,”[6] Time magazine hinted at the city’s in-between, financialized, quasi-offshore status: Miami was “Latin America’s Wall Street . . . a hemispheric crossroads for trade, travel and communications in the 21st century—a sort of Hong Kong of the Americas.” From the 1950s and 1960s, Florida became a pivot for the French Connection heroin route, for Kuomintang drugs flowing into the United States via Hong Kong (which Lansky laundered through Florida real estate), for Latin American flight money, and for Colombian drug money, often routed via the Bahamas, Panama, and the Netherlands Antilles.[7]

Jack Blum, then a Senate investigator, remembers sitting on his veranda in Miami in those days and listening to the gunfire. “This place was nuts,” he said. “The stories in the Miami Herald were so fantastic, you’d say, ‘Why hasn’t any national editor picked up on this?’” The reason, he found, was that the editors simply didn’t believe them. Blum tells of one small aircraft coming in from Colombia via the Bahamas, then getting chased by U.S. helicopters. The pilot tried to escape by flying just under a commercial jetliner, then bailing out just before landing, after first hauling overboard the cocaine with the plane on autopilot.

“The first bag goes through the roof of a house—and nobody complains,” Blum said.[8] “The second whacks the steeple off the South Miami Baptist church. The third bag falls into a community swimming pool and soaks the audience of a meeting of Crime Stoppers. The plane went down in the Everglades. The last bags probably got dragged off by alligators. He got busted.

"That happened. That happened."

By the 1980s, two-fifths of the money on deposit in Miami banks was reckoned to have originated overseas, particularly in Latin America. After 1976, the Florida region became the only one of the Federal Reserve's regions to show persistent (and huge) cash surpluses.[9] "Half the property in Miami is owned by offshore shell companies, and the largest yachts on the Intracoastal Waterway are registered offshore," said Blum. "Miami is the facility of choice for Latinex–heads of state, generals, and former friends of the CIA."

Washington did not push hard on transparency: It might frighten foreign capital owners, leading to large net outflows, and worsening an already bad balance-of-payments situation. So alternative ways were sought to stop capital from leaking out of the country. A new tax was introduced in 1963, a levy of up to 15 percent on income Americans received from foreign securities, to try to stop them from exporting capital to buy foreign bonds.[10] As we have already seen, banks instead flocked to the offshore Euromarkets to finance their activities: London-based borrowing tripled just between 1962 and 1963. Chase Manhattan and others began to book more and more loans through the Euromarkets, in London and Nassau in particular. The United States continued to bleed capital, and in 1965 the Johnson administration introduced limited controls on outward capital flows, broadening the controls in 1966 and making them mandatory in 1968.[11] "This was the first time in U.S. history there were rules to stop capital flowing out," explained Jack Blum. "And the corporate community went apeshit." In the face of all the lobbying that ensued, a compromise was accepted. Corporations could continue to keep their money offshore, and it would mostly remain untaxed and outside of these controls unless they repatriated it.[12]

In the tax world, this is a concept known as deferral: Companies may legally defer their taxes by holding profits offshore, untaxed, indefinitely. U.S. companies are only taxed on the income they bring back to the United States, usually in order to pay dividends to shareholders. Corporations know this is a bit of a game, partly depending on who is in the White House: Every now and then they are allowed to bring this un-taxed offshore money back home through amnesties. In 2004, for example, George W. Bush's administration offered his corporate friends a 5 percent tax rate instead of the normal 35 percent for companies repatriating cash. Over $360 billion whooshed back to the country through this Bush loophole, under a claim that this would

“provide jobs” as the capital returned home. Instead, however, much of it went into share buy-backs, boosting executive bonuses. The nonprofit research organization Citizens for Tax Justice, which studied the amnesty in detail,

concluded, “There is no evidence that the amnesty added a single job to the U.S. economy.”

Deferred taxes—taxes that a corporation should (in a fair world) pay this year but can choose to delay—are described by Richard Murphy, a UK-based tax expert, as “a tax-free loan from the government, with no repayment date.” This sharply reduces multinationals’ cost of capital—a very big deal indeed, especially when this is accumulated over many years—and it in turn gives them a huge competitive advantage against smaller, locally based firms.[13] When corporations dodge tax, others—that is, you and me—must pay the taxes that they won’t. The writer David Cay Johnston makes an interesting environmental comparison here. “Tax shelters are to democracy what pollution is to the environment.”[14] He is quite right too.

This concession to corporations—allowing them to defer their taxes offshore and indefinitely—has been an enormous political boost for the offshore system. “Suddenly,” Blum explains, “every major corporation uses an offshore account.” Companies focused especially on the London-centered Eurodollar market but also on Panama, then under a right-wing strongman who venerated Adolf Hitler, and on the Bahamas, where Meyer Lansky had the politicians in his pocket. In the United States, Lansky had close links to the Mob lawyer Sidney Korshak, a true American Mafia kingmaker who in turn helped build up the career of several Hollywood actors, including Ronald Reagan. Some large U.S. corporations even opened their own offshore banks.

As this happened, the interests of big-time criminals, the intelligence services, wealthy Americans, and U.S. corporations began to converge ever more strongly offshore. The system was working two transformations simultaneously: helping criminal enterprises imitate legitimate businesses, and encouraging legitimate businesses to behave more like criminal enterprises.

“The trouble is,” Blum said, “you can’t separate the channels for paying people off from the other purposes.” Although it was tax, not criminality, that most interested the corporations (and lax financial regulation that interested the banks), the big American crime families were especially pleased with the political umbrella that the corporations, and the spies, had hoisted over their offshore playgrounds. And the secrecy, in turn, provided the managers of large corporations with fabulous new opportunities for bribery, insider trading, and fraud. A new crime-friendly environment was being created for American capitalism. The

scale of this criminality can hardly be guessed at. But secrecy makes criminality possible. And in competitive markets, whatever is possible becomes necessary.

As this offshore expansion accelerated, the erosion of America from the inside gathered pace.

The oil crises of the 1970s led to high inflation: This, plus the legacy of Vietnam-era deficits, sent the dollar spiraling downward. In August 1979, U.S. president Carter appointed Paul Volcker, a renowned hard-money man, to head the Federal Reserve Board and reassure the markets. Carter cut spending, and Volcker tightened monetary policy savagely.

But Volcker had a problem. "Monetarist" theories of tackling economic problems by focusing on the money supply were coming into vogue, just at the time that unregulated Euromarkets, lacking regulation and official checks on banks' abilities to create money out of thin air, were starting to disrupt the Fed's efforts to control that very money supply.[15] Volcker called for a new cooperative international framework through the Bank for International Settlements, in Switzerland, to get other countries to stamp down on uncontrolled money creation in the offshore system. But New York bankers, in an alliance with the Bank of England and the Swiss National Bank, killed the initiative.[16]

The bankers of Manhattan began to wield the offshore system as a weapon to attack the New Deal regulations that had so effectively clipped their wings at home. In the words of Professor Ronen Palan, a leading academic authority on the offshore system, "The New York banking fraternity, led by Chase Manhattan, used the real or imagined threat posed by the Euromarket and the Caribbean tax havens—which the same banks had of course helped establish as large financial centres in the first place—to achieve their aim of more liberal financial laws."[17] If you can't beat the offshore markets, the lobbyists argued, then join them.

In June 1981, less than six months after Reagan's inauguration, the United States approved a new offshore possibility, the international banking facility. The United States was another step closer to becoming the tax haven imagined in the memo to Michael Hudson.

IBFs, as they are known, are kind of offshore Euromarkets-lite: They let U.S. bankers do at home what they could previously do only in places

like London, Zurich, or Nassau: lend to foreigners, free from reserve requirements and from city and state taxes. The bankers would sit in the same Manhattan offices as before and simply open up a new set of books and operate as if they were a branch in Nassau. Once the IBFs were in place, the banks could dispense with the subterfuge entirely and book them openly in New York. The United States had moved closer to the British offshore model.

Bankers in New York signed on to the new possibility with gusto, followed by those in Florida, California, Illinois, and Texas. In three years almost five hundred offshore IBFs had popped up inside the United States, draining money out of other offshore markets in the Caribbean and elsewhere.[18] It was a new get-out-of-regulation-free card for Wall Street and another hole in the American fortress. Not only that, but as author Tom Naylor puts it, "The US hoped to use the IBFs as a bludgeon to force other countries to relax restrictions on the entry of US banks into their domestic financial markets."

Japan followed the lead in 1986 by creating its own offshore market, modeled on the U.S. IBFs. This happened just at the start of a massive credit boom, followed by what was at the time the biggest asset market crash in history. That roller coaster had many causes, but the wildfire was stoked by the $400 billion that whooshed into Tokyo within 24 months [19] and showed local bankers what liberalized finance was all about. That year was also, as noted in chapter 4, the year of the fateful Big Bang of deregulation in the City of London, which provided Wall Street with major new escape hatches from financial regulation.

As offshore finance moved onshore, it became ever harder to tell the two worlds apart. And this, crucially, fed the giant blind spot, which persists to this day. Nearly every tax analyst took this blurring between onshore and offshore as a signal to stop trying to measure or analyze the secrecy jurisdictions, or just to focus on a few smaller, more colorful island havens. Palan, in his book The Offshore World, explains what was really happening. "Far from signalling the decline of offshore," he wrote, "the process "must be interpreted as the embedding of offshore in the global political economy."[20]

John Christensen remembers noticing this blind spot in 1986. He was working as a development economist in Malaysia and came across some odd local structures known as deposit-taking cooperatives. These

were unregulated quasi-banks that took large volumes of deposits from Malaysian widows and orphans and channeled the money offshore. In July 1985, one of these cooperatives offered him a king prawn luncheon at a sumptuous office penthouse in Kuala Lumpur, washed down with

Guinness and Courvoisier. As the lunch wore on, it became apparent that the chief financial officer, a leading light in the Malaysian Chinese Association, wanted to steer the conversation toward Christensen's childhood roots over six and a half thousand miles away in the crown dependency of Jersey, and he was especially interested in its status as a tax haven. He wanted to know if it was safe to invest.

Christensen resolved to look into the cooperatives. "The whole thing was a massive scam," he said. "The Central Bank wouldn't regulate it and nobody else would touch it. Everyone said 'keep away.'" Their international offshore dimension made it impossible for anyone locally—whether curious depositors or government regulators—to find out what was really happening: how profits were being shifted to insiders and risks heaped onto the shoulders of ordinary Malaysian depositors or taxpayers. After doing detailed research, Christensen was able to get an article published in the Business Times of Singapore in December 1985 before leaving the country as the ensuing scandal broke. Within months the central bank had suspended twenty-four cooperatives amid a massive run by depositors.

Back in Britain Christensen spent a couple of months combing libraries and seeing all the economists and capital markets experts he could find to try to understand where the money was flowing and how the offshore system worked. Nobody knew anything. "I don't think anyone understood how malevolent this thing had become," he said. "There was no useful information anywhere."

As the Vietnam War heated up, Michael Hudson worked out that the whole of the U.S. balance-of-payments deficit could be attributed to the costs of Vietnam. And the deficits, later worsened by the great Reagan tax cuts of 1981, posed a quandary. American companies needed to borrow money by issuing bonds, but if they borrowed it all at home, they would compete for funds with the U.S. government, pushing up interest rates and crimping economic growth. So it would be best if they could borrow from overseas.

But there was a hitch. A French investor, say, who wanted to buy some bonds faced a simple choice: either invest in American bonds, and pay a 30 percent withholding tax on the bond income, or hop on the "coupon bus" to Luxembourg and earn income tax-free, and in secret,

from Eurobonds. Many investors saw this as no choice at all. They shunned American bonds.

So American policymakers had a problem. The United States wasn't a tax haven, they reasoned, and they didn't want to help tax cheats unnecessarily. They wanted American companies to borrow overseas, but they wanted to keep the 30 percent tax too, for the revenue. How to square this circle?

At first, they settled for a compromise. American corporations could cook up a version of what was known as a "Dutch Sandwich"—set up an offshore finance subsidiary in the Netherlands Antilles, then use it to issue tax-free Eurobonds and send the proceeds up to the American parent. The United States could argue that it did not have to tax this income from the Antilles, under the rules of its tax treaty with this former Dutch colony via its postcolonial relationship with the Netherlands.

The U.S. Internal Revenue Service could easily have decided that the Dutch Sandwich was a sham and taxed the income. But it looked the other way. "These were Eurobonds, bearer bonds, which were virtually impossible to tax," explained Michael J. McIntyre, a top U.S. expert on international tax, who was one of very few people in the United States to have opposed this at the time. "You British people were quite happy about (the tax-free, secretive Eurobond markets). And we wanted in. We wanted to attract the hot money too."

David Rosenbloom, who was in charge of these matters at the U.S. Treasury during the years 1978–80, also remembers how questionable these officially tolerated offshore antics were. "People were very nervous. Those companies wanted access to the Eurodollar market, and they really wanted security," he said. "The Antilles structures were kind of phoney—these were paper entities; they weren't doing anything real. They existed in some notaire's desk drawer down in Curaçao."[21]

In response to the Antilles structures, the Carter administration commissioned a major survey of secrecy jurisdictions that was published in January 1981, the month Reagan came to power.

The Gordon report, as it was called, was probably the first really serious challenge to the havens in history. It condemned tax havenry as a situation that "attracts criminals and is abusive to other countries" and called on America to lead the world to crack down. Published a week before the Reagan inauguration, it quickly sank out of view. Yet the report was an acknowledgment that there was a big problem, and in this, it was new. "I can't remember any overarching 'Let's go after the havens' thing prior to the Gordon report," said Rosenbloom.

While the Bahamas and Switzerland were certainly on the radar screen, he said, the Netherlands Antilles was the big one. Eventually, the United States told the Netherlands Antilles it wanted to renegotiate the treaty.

"A whole bunch of rulings came down that scared the bejesus out of everybody," said Rosenbloom. "These were the days when people were actually afraid of our tax authorities."

But there was another hitch: Having tacitly encouraged the Antilles loophole, the United States was not in a great position to object. "From the point of view of U.S. tax policy these things were utterly objectionable, but the U.S. government had its hands completely dirty," Rosenbloom continued. "The government was in a bad position to start getting all self-righteous about this.

"The Antilles could have gotten a decent treaty that would have let them carry on doing business in some form. I was prepared to compromise. I didn't think we had the gumption to do this."

Yet the Dutch Antilles overplayed its hand. "They were holding out," Rosenbloom said. "They thought they could push the United States around in treaty negotiations. They wanted more of this and more of that, and this benefit and that benefit . . . they just held tough on all sorts of positions that we couldn't accept."

American corporations grew skittish. And out of the commotion, a new approach was hatched: From 1984, the United States would bypass the Antilles irritant entirely and waive the 30 percent withholding tax under a new loophole.[22] American companies would no longer set up fictional entities in Curaçao but simply issue their bonds at home. Foreign investors would pay no tax on their bond income.

It was a classic tax haven gambit: plug the deficits by exempting foreigners from tax, and watch as the world's hot money rolls in. It was just as the memo handed to Hudson in the elevator had anticipated.

The loophole was supposed to be available to foreign investors only. Unscrupulous wealthy Americans, of course, got around that simply by covering themselves in a cloak of offshore secrecy and pretending to be foreigners.

"The Wall Street types were as happy as clams," said McIntyre. "The rules were designed to facilitate tax evasion. It was a

very hot business: People in high places liked it and fostered it. They didn't think it was an ethical issue. . . . Nobody seemed to object, except my brother Bob and I."[23]

The effects were immense. Having set up offshore-lite international banking facilities in 1981, America, by 1984, had a thriving homegrown offshore bond market.

> "Suddenly," noted Time magazine, "America has become the largest and possibly the most alluring tax haven in the world." From then on, a drip-drip of new laws and statutes nibbled away at America's onshore defenses.

In the late 1990s, Bill Clinton's treasury secretary and former Goldman Sachs cochairman Robert Rubin deepened the offshore corrosion with a devious new piece of legislation, the Qualified Intermediary Program. And here lies another nauseating tale.

U.S. authorities wanted to protect the nation's own tax base by finding out about American accounts at foreign financial institutions. Yet they could not simply request all the information—about both foreigners and U.S. citizens—then simply sift out the U.S. tax cheats and ignore the foreigners. If it did receive information about foreigners, the United States would be obliged under its tax treaties to tell foreign governments about their citizens' U.S. investments. Those citizens would then take their money out of the United States and park it somewhere else, where it would remain secret. U.S. deficits would widen.

The answer was to outsource the screening to foreign banks. They would tell the United States only about U.S. citizens and not pass on any information about foreigners. And if the United States did not have the information, then it would have nothing to exchange with foreign jurisdiction—and it wouldn't be breaking its treaties. "The rules were designed to make it difficult for the U.S. government to learn who the tax cheats were," McIntyre explained.[24] "This evasion was intended to benefit U.S. borrowers by allowing them to borrow from the tax cheats at a reduced interest rate."[25] It was another classic offshore ruse. A tax haven sets up worthy treaties that require the haven to exchange information with foreign jurisdictions. Then they set up the structures to make sure that they never have the information to exchange in the first place. They keep their secrecy, but by pointing to their treaties they can claim that they are a transparent and cooperative jurisdiction.

Next, the banks simply lied to the U.S. authorities about what they were doing. Under cover of the Qualified Intermediary Program, members of the Swiss aristocracy would stalk the America's Cup and

Boston Symphony Orchestra concerts for wealthy Americans, then set them up with tax evasion schemes, even smuggling diamonds in toothpaste tubes to help them evade tax. Then they would check the box to confirm they were respecting American banking laws.

Rosenbloom encapsulated the cynicism in a nutshell. "The program was not aimed at identifying Americans," he said. "The program was aimed at protecting the identity of foreigners while allowing them to invest in the U.S." This narrow focus meant that only very clumsy or poorly advised American tax evaders would ever be caught.

A veteran official Washington investigator who asks to remain anonymous described how one American lawyer responded to the Qualified Intermediary Program. "This guy has a wonderful practice teaching people how to game the system," he said. "The first thing he does is put together a PowerPoint to the banks in central European secrecy jurisdictions, on how to get around the reporting obligations."

"That sonofabitch yelled at me down the phone," the investigator continued. "This is such an abuse of part of our legal culture. They fought [the U.S. government] every step of the way."

The Clinton administration, to be fair, issued proposed regulations near the end of its second term that would provide OECD countries with information about their citizens' U.S. bank deposits. U.S. banks, especially those with major deposits in Florida and Texas, lobbied hard against them. George W. Bush's administration dropped them.[26]

The United States sells financial secrecy not just at the federal level but at the state level too. Delaware is the biggest state provider of offshore corporate secrecy, but Nevada and Wyoming are the most opaque: They allow bearer shares, a vehicle of choice for mobsters and drugs smugglers, and they are particularly lax on allowing company directors and other officers to be named, hiding the identities of the real owners. Nevada does not share tax or incorporation information with the federal government and does not require a corporation to report where it does business. The IRS has no way of knowing whether a Nevada corporation has filed a federal tax return. Arkansas, Oklahoma, and Oregon are also routinely used for fraud by eastern Europeans and Russians, and, as noted, Texas and Florida are havens for illicit Latin American wealth.

In the 1990s, the U.S. government gave millions in aid to help the

former Soviet Union countries improve the security at their nuclear power plants. Much of it went missing. When the U.S. Department of Justice went looking for the money, investigators finally tracked it to anonymous shell companies in Pennsylvania and Delaware. Most cases involving financial market manipulations that the FBI has studied have involved U.S. shell companies from these states. The notorious "merchant of death" Viktor Bout, inspiration for the character played by Nicholas Cage in the Hollywood film Lord of War, alleged arms runner to the Taliban and other murderous organizations around the globe, operated through businesses in Texas, Delaware, and Florida.[27]

"US shell companies are attractive vehicles for those seeking to launder money, evade taxes, finance terrorism, or conduct other illicit activity anonymously," said Republican Senator Norm Coleman, then chairman of the U.S. Senate Permanent Subcommittee on Investigations. "Competition among States to attract company filing revenue and franchise taxes has, in some instances, resulted in a race to the bottom."[28]

A New York Times article from 1986 describes the antics of one Delaware lieutenant-general who flew to Taiwan, Hong Kong, China, Indonesia, Singapore, and the Philippines, clutching a pamphlet boasting that Delaware could "Protect You from Politics."[29] The official was, the article noted, "looking forward to a rich harvest of Hong Kong flight capital" after the British pullout in 1997. "You don't have to tell us the details of your business; you don't have to list who's on your board or who's holding office; and you don't have to use your name and address—just use your Delaware agent's." For an extra $50, you could get this in 24 hours.

Today, an "aged shelf company" will help you pretend you have been trading for years, when in fact you've just started up. "It's an effective means to create a perception of business stability," one registered agent advertises. "Most people won't ask…. There's nothing wrong with immediate gratification, as long as it's affordable!" Behind the secrecy, nobody can discover the deception. All this, and more, is yours for $299.

A limited liability corporation (LLC) might offer certified copies of the passports of that company's directors. That looks reassuring, but even with genuine passport copies you are no closer to knowing who really owns the company or its assets: These directors are probably professional nominees who work for hundreds of such corporations. Typically the nominee

director will route all queries via a company attorney who has contact with the real people, and when crime-fighters come looking, the attorney will hide behind attorney-client privilege and claim he or she cannot reveal the information. “That’s a secrecy jurisdiction right there, in his office,” one irate U.S. government investigator told me. “The lawyers are worse than the bankers. And there are the securities firms, and accountants. They are all involved.”

These LLCs are a filter between the assets and the owner, screening out the information. U.S. states cream off a few hundred dollars in fees, and crimes around the world go unpunished.

A Wyoming website boasts that “Wyoming Corporations and LLCs have a tax haven within the United States with no income taxation, anonymous ownership and bearer shares…. Shelf Corporations and LLCs: Anonymous entity where YOUR NAME IS ON NOTHING! These companies already exist and are complete with Articles, Federal Tax ID numbers and registered agents…. You may have these complete companies by TOMORROW MORNING!”

Yours for $69, plus modest state filing fees.[30]

These places are selling a cheap and very strong form of secrecy.[31] In Switzerland, information is typically retained, but secrecy laws mean locals may not disclose it. States like Wyoming have no such prohibitions on breaking the secrecy: The trick is simply to ensure no information is available in the first place. All company records may be kept outside the state—in North Korea, for instance—so even if the authorities wanted to find out what your company was about, they couldn’t. Stock can be transferred instantly and privately without filing a public notice.

With its corporate laws, the United States does not even comply with the transparency requirements of the IMF’s rather toothless IMF Financial Action Task Force, which requires countries to be able to identify beneficial owners. When congressional staffers and others have tried to change this, they have met ferocious lobbying from these states and from the American Bar Association.

“When other countries ask us for company owners, we have to stand red-faced and empty-handed,” said Senator Carl Levin. “The United States has been a leading advocate for transparency and openness. We have criticized offshore tax havens for their secrecy and lack of transparency. We have pressed them to change their ways. But look what is going on in our own backyard.

“America should never be the mattress corrupt foreign officials use to

hide their money."[32]

Secrecy is just one of several lures that individual U.S. states offer to financial capital elsewhere. Tax is another lure, though a fairly minor one. Certain types of state corporations shield residents from state income tax, asset tax, sales tax, stock transfer tax, or inheritance tax, and U.S. corporations push trademarks, patents, and other nebulous things into low-tax states in a transfer pricing game to cut state taxes. World-Com, for instance, shifted nearly $20 billion tied to "management foresight" to a Delaware company before it collapsed in 2002. Tax is never the individual states' top attraction, though: Corporations paying no state taxes owe U.S. federal taxes.

Two further lures have turned certain U.S. states into corporate havens. One involves usury; I will explore this in chapter 10. The other involves corporate governance, which is largely governed in the United States by state, not federal, laws. In both of these, Delaware plays a starring role.

What ties all these different strands together—the tax, the secrecy, the usury specialties, and the corporate governance—is the political establishment of this tiny state, where everyone knows everyone else and Democrats and Republicans alike seem to share a uniform opinion that local laws must be shaped to satisfy corporate desires, to attract business for the state—and the rest of the world can take care of itself. Only a definition of offshore like the one I use in chapter 1—focusing on how locals prioritize their own interests explicitly at the expense of others—enables us to tie together the four strands mentioned above and to understand what is going on.

A brief look at the story of Delaware helps bring this historical section of the book up to the present day.

Delaware, the second smallest of the U.S. states, is home to many of the world's biggest corporations. Conventional definitions of tax havens—those that focus on tax—fail to capture Delaware as a part of the offshore system. But something important is clearly happening here: Over half of U.S. publicly traded companies and nearly two-thirds of its Fortune 500—Coca-Cola, General Motors, ExxonMobil, you name it—are incorporated here; the little state hosted over 90 percent of all

IPOs in the United States in 2007. These corporations don't have their headquarters here; they are just incorporated there. Being in Delaware gives modest tax advantages over other states, but the killer lure is, as I've said, laissez-faire standards of corporate governance that give tremendous power to corporate managers.

Delaware has long been a refuge for financial capital. In 1899 the state government, influenced by the du Pont family, who wanted to incorporate their chemical industries,[33] adopted a new and permissive corporation law that reflected the laissez-faire spirit of an age of growing corporate power. In Delaware, the message went, company managers gain huge leeway to do what they want at the expense of other stakeholders. Other states began to follow suit. "Even as the starter's gun went off," the Chancery Court's official history puts it, "Delaware was already being accused of leading a 'race to the bottom.'" This classically offshore theme has remained a permanent character of Delaware history. In 1974 William Cary, a former chairman of the U.S. Securities and Exchange Commission, wrote in a landmark article in the Yale Law Journal that Delaware law has "watered down the rights of shareholders vis-à-vis management to a thin gruel" and that "necessary high standards of conduct cannot be maintained by courts shackled to public policy based upon the production of revenue, pride in being 'number one,' and the creation of a 'favorable climate' for new incorporations."

To be fair to Delaware, there are healthier reasons for incorporating here. Its Chancery Court has become—because of Delaware's success in attracting out-oftowners—the specialist in corporate law, with unrivaled experience and expertise.[34] And its location halfway between New York and Washington gives Wilmington a fearsome geographical edge too. Who wants to fly to Alaska to litigate?

The Delaware Chancery Court has a "business judgment rule" under which courts should not second-guess corporate managers, provided they have not blatantly violated some major rule of conduct and their decisions are approved by a "neutral" decision-making body. Whatever one thinks of this approach, Delaware has taken it to extreme lengths, granting corporate bosses extraordinary freedoms from bothersome stockholders, judicial review, and even public opinion. As Bernard Black, a professor of law at Columbia University, wrote in 1998, "Shareholders haven't been able to stop managers, and their allies on

the Delaware Supreme Court and in state legislatures, from chilling hostile takeovers through poison pills, antitakeover statutes, and judicial decisions that let managers 'treat shareholders like morons' who are incapable of understanding a firm's true value."[35]

In 2003 Delaware passed new legislation expanding the Chancery Court's jurisdiction, and the official synopsis said the aim was to "keep Delaware ahead of the curve in meeting the evolving needs of businesses, thus strengthening the ability of the state to convince such businesses to incorporate and locate operations."[36] J. Robert Brown, a professor of corporate law at Denver University and a leading critic of Delaware courts, said that "Delaware courts have all but eliminated meaningful limits on self-interested transactions."

A Reuters story in May 2010 provided a fascinating insight into one role Delaware's incorporation business played in the latest financial crisis.[37] The story examines the "dean of CDOs," a retired University of Delaware finance professor who became the sole independent director of the Delaware-based corporations behind more than two hundred mostly subprime- backed CDOs, including ones underwritten by Goldman Sachs and Morgan Stanley. Independent directors are supposed to bring unbiased opinions to company boards and ought to be what one expert terms "the cornerstone of good corporate governance."[38] Janet Tavakoli, a Chicago-based structured finance consultant, said these independent directors "are basically there just as a rubber stamp." We will see a lot more of Delaware's role in the financial crisis later, but the point for now is that allowing toothless directors for securitization deals, just like Nevada's tolerance for nominee directors who reinforce corporate secrecy, is offshore business.[39]

Richard Murphy of Tax Research UK captures the artificiality of these arrangements. "Offshore is used to repackage what happens elsewhere," he said. "It is used to change the form, but not the substance, of a transaction." A world-famous totem to this artificiality is Ugland House, in the Cayman Islands, which Barack Obama once criticized for housing over twelve thousand corporations: "either the biggest building," he said, "or the biggest tax scam."[40] When Obama said that, Antony Travers, chairman of the Cayman Islands Financial Services Authority, fired right back. Obama would be better advised to focus his attention in Delaware, where, he said, "an office at 1209 North Orange Street, Wilmington, houses 217,000 companies."

After Travers said that, I had to see the world's biggest building.

This, as it happens, is the office for the Corporation Trust, a subsidiary of the Dutch firm Wolters Kluwer. It is just at the edge of Wilmington's small financial center: a forgettable yellowish brick low-rise with a modest maroon awning: the kind you'd find outside a pizza restaurant. It sits between the scruffy little parking lot behind it and the unsightly six-story parking garage across Orange Street, and it is, legally speaking, the corporate home of Ford, General Motors, Coca-Cola, Kentucky Fried Chicken, Intel Corp., Google Inc., Hewlett Packard, Texas Instruments, and many more global corporate giants, including many of the specialized trusts and Special Purpose Entities (SPEs) that underlay the latest financial crisis. These corporations are not here for secrecy but for the corporate governance. The Corporation Trust will, as part of the service, also help your company serve and receive notices, subpoenas, summons, and the like. Delaware's government website lists 110 registered agents—these, by the way, are not regulated.[41] In 2008 Delaware hosted 882,000 active business entities: one for every man, woman, child, and baby in the state.[42]

Before visiting the building, I called repeatedly to request an interview with the management of the Corporation Trust. Each time I was promised a call back, which never came, until I eventually caught a new receptionist who put me through to the office manager, Cory Bueller. Evidently flustered, she agreed to see me. I turned up ten minutes ahead of time and was buzzed into a reception room about twelve by twelve feet, with an aging, scuffed gray-patterned carpet, two potted plants, and light-colored walls dotted with odd grease smears. Behind a glass window sat the receptionist, a slightly unshaven black man in a baseball jacket, who was replaced soon after I arrived by an attractive, well-dressed young woman in a vivid red coat, who smiled brightly and promised that Bueller would be out shortly.

Bueller came through the door in faded jeans, white sneakers, a white T-shirt, and a gray cardigan and said sheepishly that she couldn't give me that interview after all. I asked if I could have a quick nose around. That would not be possible, she said, wringing her hands. I pressed again. "Just a quick peek?" A flush of color came to her cheeks, and she declined again. She would not give me her own card but instead passed me a piece of headed paper with a phone number for Wolters Kluwer's New York press office. Back outside, I could see long rows of work cubicles through one window. It looked very similar to what I had been able to see of the ground floor of the Caymans' Ugland House. This was clearly a place for secretarial work: Bueller did confess under my

questioning that about 80 people worked there, and none were lawyers.

As late as the early 1990s, mainstream development theorists trying to work out why some states were failing, or why poverty was so widespread, all but ignored the issue of corruption. Berlin-based Transparency International (TI), founded in 1993, put corruption on the map, launching its famous Corruption Perceptions Index (CPI) two years later. The Financial Times nominated 1995 as the International Year of Corruption; and the World Bank, which had previously been so polite toward developing country elites that it all but banished the c-word from its policy documents, followed TI's lead in 1996 when its president, James Wolfensohn, accepted in a landmark speech that the bank needed to deal with "the cancer of corruption." The OECD's Anti-Bribery Convention came into force only in 1999, and the UN's Convention Against Corruption was only solidified in 2003. In many OECD countries, bribery was even tax-deductible until just a few years ago.

Even so late, the shift was very good news. But now consider this.

TI's corruption ranking is invaluable to investors trying to assess "country risk." But Nigerians already know that their country is among the world's most corrupt. They want to know where almost $500 billion worth of their oil money has gone. The corruption index gives no clues. After the brutal Nigerian president Sani Abacha died in 1998, poisoned while in the company of Indian prostitutes, it was revealed that he had raked off billions of dollars of oil money from state coffers. Two countries in particular had soaked up his embezzled wealth: Britain and Switzerland. The Nigerian finance minister Ngozi Okonjo-Iweala revealed the problems in an interview with journalist Paul Vallely of The Independent in May 2006.[43]

NGOZI: The Swiss have now returned $500 million of stolen resources. Switzerland has set the example.

VALLELY: What about the British?

She gives a long throaty chuckle.

NGOZI: Now heaven help me. It's very hard to condemn the British. On debt relief the UK has set the example.

VALLELY: So why are the British dragging their feet on the repatriation of stolen resources?

NGOZI: It's been more difficult with the British. Our president has raised it many times with Prime Minister Blair. Eventually he returned $3m. We understand there are other monies but while all the discussion was going on those monies left the country and went somewhere else.

TI's rankings suggest that Britain and Switzerland, not to mention the United States, are among the world's "cleanest" jurisdictions. In fact, about half the top 20 in the index are major secrecy jurisdictions, while the nations of Africa—the victims of the gargantuan illicit flows—are ranked the "dirtiest."[44]

Clearly, something is wrong here.

In November 2009 the Tax Justice Network published a new index based on two years of work by a dedicated team. Named the Financial Secrecy Index, it ranked countries according to how important they are in providing financial secrecy in global finance. It did this by looking at a range of key secrecy indicators and structures to see how secretive a jurisdiction was, then weighting each according to the scale of cross-border financial services activity that it hosts.

Nothing like this had ever been done before, and newspapers and television stations around the globe published the results, with some of the countries traditionally seen as the "cleanest" being ranked as among the world's least transparent.

In fifth place in the Financial Secrecy Index was the United Kingdom. Although it has by far the most important historical role in the emergence of offshore, and it is the center of the British offshore spiderweb, its own domestic secrecy structures in themselves are relatively transparent. Third and fourth most important were, respectively, Switzerland and the Cayman Islands. Luxembourg, a gigantic but hardly noticed haven of financial secrecy, came second. And which country was ranked—by a mile

—the world's most important

secrecy jurisdiction?

Step forward, the United States of America.

THE DRAIN
How Tax Havens Harm Poor Countries

BY THE EARLY 1980S THE MAIN ELEMENTS of the modern offshore system were in place and growing explosively. An older cluster of European havens, nurtured by old European aristocracies and led by Switzerland, was now being outpaced by a new network of more flexible, aggressive havens in the former outposts of the British empire, themselves linked intimately to the City of London. A state within the British state, the City had been transformed from an old gentleman's club operating the financial machinery of empire, steeped in elaborate rituals and governed by unspoken rules about what "isn't done," into a new, brasher, deregulated global financial center dominated by American banks and linked intimately to this new British spiderweb. A less complex yet still enormously important offshore zone of influence had also grown up, centered on the United States and constructed by U.S. banks. The stateless Euromarkets linked all these zones with each other and with the onshore economies, helping free banks from reserve requirements and other democratic restraints on their behavior.

While the old European havens were mostly about secret wealth management and tax evasion, the new British and American zones were increasingly about escaping financial regulation—though with plenty of tax evasion and criminal activity thrown in, of course. Players in each zone were warmly welcomed into the others, in true laissez-faire style, and as the offshore system became more interconnected it grew stronger too, as states competed with each other in races to the bottom on lax financial regulation, tax, and secrecy in order to lure financial capital. This competition also helped force offshore practices steadily onshore, making it harder to tell the two apart.

The Bretton Woods system of international cooperation and tight controls over financial flows had collapsed in the 1970s, bringing to an end the so-called golden age of capitalism that followed the Second World War. The world had entered a phase of much slower growth,

punctuated by regular financial and economic crises, especially in the developing world.

And as all this happened, and the offshore system grew and metastasized all around the global economy, a new and increasingly powerful pinstripe army of lawyers, accountants, and bankers had emerged to make the whole system work. Offshore, in partnership with changing ideologies, was driving the processes of deregulation and financial globalization. In particular, the London-based Euromarkets, then the wider offshore world, provided the platform for U.S. banks in particular to escape tight domestic constraints and grow larger again, setting the stage for the political capture of Washington by the financial services industry, and the emergence of too-big-to-fail banking giants, fed by the implicit subsidies of taxpayer guarantees, plus the explicit subsidies of offshore tax avoidance, that continue to hold western economies in their stranglehold today. The emergence of the United States as an offshore jurisdiction in its own right attracted vast financial flows into the country, bolstering bankers' powers even further. The old alliance between Wall Street and the City of London, which collapsed after the Great Depression and the Second World War, had been resurrected.

Many people supposed that by eliminating double taxation and creating nearly frictionless conduits for financial capital, the offshore system was promoting global economic efficiency. In reality the system was rarely adding value, but was instead redistributing wealth upward and risks downward, and creating a new global hothouse for crime.

The U.S. crime-fighting lawyer John Moscow summarized the problem. "Money is power and we are transferring this power to corporate bank accounts run by people who are in the purest sense of the word unaccountable and therefore irresponsible."[1]

Secrecy jurisdictions had penetrated the public consciousness, a little, but still only as marginal, dubious oddities at the exotic fringes of civilization. Under cover of this great misunderstanding, often artfully encouraged by those who wanted to conceal the true nature of the new financial revolution, the offshore system would play out in ways that would become increasingly significant in the 30 years to follow.

What was happening was nothing less than a head-on assault on the progressive New Deal in the United States; on the foundations of social democracy in Europe; and on democracy, accountability, and development in vulnerable low-income countries across the world.

Take any significant economic event or process in the last few decades, and offshore is almost certainly behind the headline and probably central to the story.

Poverty in Africa, for example, cannot be understood without understanding the role of offshore. The world's worst war for years has been the civil conflict in the Democratic Republic of Congo, which is tied in with the wholesale looting of its mineral resources—via tax havens. Large-scale corruption, and the wholesale subversion of governments by criminalized interests, across the developing world? Offshore is central to the story, every time. Nearly every effort to generate large flows of capital to developing countries since the 1980s has ended in crisis because the money has escaped offshore. Towering inequalities in Europe and the United States, not to mention in underdeveloped countries, cannot be understood properly without exploring the role of secrecy jurisdictions. The systematic looting of the former Soviet Union, and the merging of the nuclear-armed country's intelligence apparatus with organized crime, is substantially a story that unfolds in London and its offshore satellites. The political strength of Saddam Hussein had important offshore underpinnings, as does the power of North Korea's Kim Jong-Il today. Prime Minister Silvio Berlusconi's strange hold over Italian politics is significantly an offshore story. The Elf affair, discussed earlier, which helped powerful French elites float above and out of reach of French democracy, had secrecy jurisdictions at its heart. Promoters of frauds such as "pump and dump" schemes to hype up stocks, then dump them on an unsuspecting public, always hide behind offshore entities. The death of a Russian oligarch's lawyer in a mysterious helicopter crash? Arms smuggling to terrorist organizations? The growth of mafia empires? Offshore. The narcotics industry alone generates some $500 billion in annual sales worldwide[2]: To put this into perspective, that is twice the value of Saudi Arabia's oil exports.[3] The profits made by those at the top of the trade find their way into the banking system, the asset markets, and the political process through offshore facilities. You can only fit about $1 million cash into a briefcase. Without offshore, the illegal

drugs trade would be more like a cottage industry.

Financial deregulation and globalization? Offshore is the heart of the matter, as I will show. The rise of private equity and hedge funds? Offshore. Enron? Parmalat? Long Term Capital Management? Lehman Brothers? AIG? Offshore. Multinational corporations could never have grown so vast and powerful without the tax havens. Goldman Sachs is very, very much a creature of offshore. And every significant financial crisis in the world since the 1970s, including, as noted, the latest global economic crisis, is very much an offshore story. The decline of manufacturing industries in many advanced countries has many causes, but offshore is a big part of the story. Tax havens have been central to the growth of debt in our economies since the 1970s. The growth of complex monopolies in certain markets, or insider trading rings, or gigantic frauds, almost always involves secrecy jurisdictions as major or central elements.

This is not to say that all of these problems don't have other explanations too. They always do. Tax havens are never the only story because offshore exists only in relation to elsewhere. That is why it is called offshore.

Without understanding offshore, we will never properly understand the history of the modern world. The time has come to make a start in filling this gigantic hole in our knowledge and to appreciate the gravity of offshore: how it has bent the world's economy into its modern, globalized shape, transforming societies and political systems in its image.

I will now describe a rare episode where offshore's role is widely acknowledged: the case of the Bank of Credit and Commerce International (BCCI), arguably the most offshore bank in history. The story is well known, but for one or two crucial features.

The BCCI case broke open after Jack Blum, a lawyer and investigator working for John Kerry's Foreign Relations Committee, began picking up signs of wrongdoing in 1988.

Like most people, Blum initially saw secrecy jurisdictions mainly as centers for drug smugglers and other assorted lowlifes. But on a visit to the Cayman Islands in 1974 for the U.S. Senate Foreign Relations Committee, he remembers seeing a line of well-dressed men waiting to use the phone in his hotel lobby. He learned that they were U.S. lawyers

and accountants arranging to meet Cayman bankers to set up bank accounts and trusts for tax-evading U.S. clients. The American bankers were referring U.S. customers to their Canadian colleagues, and the Canadians were returning the favor. Over time, he began to notice more sophisticated tricks and to see that this was far bigger than almost anyone imagined.

"I began to see that drugs were only a fraction of the thing," Blum said. "Then there was the criminal money. Then the tax evasion money. And then I realized—'Oh my God—it's all about off the books, off the balance sheet. Offshore, there are no rules about how the books are kept,'" he continued. "I refer to offshore as a kitchen, where corporate books are cooked."

When contacts started fingering BCCI in the late 1980s, Blum already knew it had a bad smell: He had worked previously in private practice, where he remembers his team meeting the staff of Mellon Bank in Pittsburgh and telling them about BCCI. "The entire senior international staff at Mellon just about threw up on the table," Blum said. They would not, under any circumstances, accept letters of credit from BCCI.[4]

The bank was set up in 1972 by an Indian-born banker, Agha Hassan Abedi, who got backing for his venture from members of the Saudi royal family and from Sheikh Zayed Bin Sultan Al-Nahayan, the ruler of Abu Dhabi. BCCI grew superfast under a simple business model: create the appearance of a reputable business, make powerful friends, then agree to do anything, anywhere, on behalf of anyone, for any reason. BCCI larded politicians with bribes and served some of the twentieth century's greatest villains: Saddam Hussein, the terrorist leader Abu Nidal, the Colombian Medellin drug cartel, and the Asian heroin warlord Khun Sa. It got involved in trafficking nuclear materials, in sales of Chinese Silkworm missiles to Saudi Arabia, and in peddling North Korean Scud-B missiles to Syria. Its branches in the Caribbean and Panama serviced the Latin American drug trade; its divisions in the United Arab Emirates, then amid an oil boom and an offshore banking bonanza, serviced the heroin trades in Pakistan, Iran, and Afghanistan; and it used Hong Kong to cater to drug traffickers in Laos, Thailand, and Burma. It also got into the U.S. banking system, getting around the concerns of U.S. regulators by using offshore secrecy structures to make its ownership invisible. It paid off Washington insiders and built up a solid partnership with the CIA. This gave it fearsome political cover and made Blum's investigations extraordinarily difficult from the outset.

"There was an army of people working in Washington on all sides trying to say this bank was a wonderful bank," Blum said. Friends in law enforcement warned him that his life was in danger, but he pressed on. He took the case to the Manhattan district attorney Robert Morgenthau, who shared Blum's outrage and put a team together to take BCCI down. Fighting against what must have seemed like half the political insiders in Washington, Morgenthau helped shut it down in 1991 and charged BCCI and its founders with perpetrating "the largest bank fraud in world financial history."

But the most interesting thing about BCCI was its offshore structure.

Abedi split his bank between jurisdictions, registering holding companies in Luxembourg and in the Caymans, so that no regulator could see the whole thing. Different auditors were used for different parts of the bank too.[5] Yet he also wanted the credibility of being in a world-famous financial center, though it would need to be lax enough to ask few questions. That meant only one place: the City of London. In 1972 BCCI set up its headquarters in luxury offices in Leadenhall Street, at the heart of the City, and began making generous contributions to Britain's Conservative Party.[6]

A rule of thumb was that banks should lend no more than 10 percent of their equity capital to a single borrower—but BCCI was making loans to some clients worth three times its capital or thirty times the accepted ratio. In 1977 the Bank of England tightened these rules further. To get around this, Abedi dumped shaky loans in the Cayman Islands, where, as a BCCI official noted at the time, there was "obviously more flexibility in record-keeping" and which bank officials called "The Dustbin."[7] Neither the British regulators, nor those in Luxembourg or the Caymans, assumed responsibility.

BCCI also constructed an audacious but simple offshore trick: to manufacture equity capital—the foundation and safety buffer of any bank—out of thin air. The Luxembourg bank would lend money to a BCCI stockholder—one of Abedi's friends— who would then invest this money in the Caymans bank, building up its capital there. Likewise, the Caymans bank lent money to a stockholder who would use it to create capital in the Luxembourg bank. From just $2.5 million in equity capital at the beginning, BCCI had raised nearly $850 million by 1990, with the help of this offshore bootstrap.[8] Abedi also wrote off his friends' debts but kept expanding by operating a Ponzi scheme: milking the staff pension fund and taking in more deposits simply to pay its outgoings. Many of its eighty thousand depositors were relatively poor people from the

developing world who had no idea that this apparently London-based bank, backed by wealthy Arab Sheikhs, was a fiction piled on a fiction.

"There is no way to learn banking from books: it is bullshit," said Blum, highlighting the make-believe possibilities that emerge in the liberated offshore environment. "Nothing tells you how money-laundering generates products."

When Morgenthau tried to probe the bank, the Caymans authorities refused to cooperate. “We subpoenaed BCCI Overseas—they told us, ‘Sorry: the laws of Cayman don’t permit us to do this,’” he said, expressing particular irritation with the attorney general, a “crotchety British guy” named Alan Scott.[9] “We tried again. Finally, they said we had to go through the (U.S.-Cayman tax information exchange) treaty. We went through the treaty. Then they said, ‘The treaty doesn’t include local District Attorneys: go through the Justice Department. We can’t show this to you.’ The Justice department wasn’t overly cooperative either.” [10]

Morgenthau and his deputy John Moscow went to the Bank of England. “We had no cooperation from the Bank of England,” Morgenthau said. “We tried to get financial records out of London; they didn’t provide us with anything.”

With the help of Senator John Kerry, Morgenthau threatened to raise a public storm if the Bank of England did not act. Only then, finally, the Bank agreed to shut BCCI down.

In the British parliament, the scandal caused an uproar. The Bank, forced onto the defensive, claimed it had left BCCI running until 1991 because there had been no “solid evidence” of fraud until then.

It isn’t clear what other evidence the Bank needed. Indictments in the United States implicating BCCI in fraud dated back two and a half years; one stated that money laundering was part of its “corporate strategy.”[11] Price Waterhouse had issued a qualified audit report on a BCCI subsidiary in 1989; and in 1990 BCCI employees had written to the Treasury, the Bank of England, and British ministers to warn of fraud inside the bank. That same year, Britain’s intelligence services had told the Bank of England that Abu Nidal controlled 42 BCCI accounts in London; the Bank for International Settlements in Basel had expressed concern; and in mid-1990 Price Waterhouse had discovered the so-called Naqvi files, revealing widespread fraud, fictitious companies, unrecorded deposits, manufactured loans, and evidence of stealing from depositors, findings that were passed along to the Bank of England. Still there was no action, even though BCCI headquarters were only a few minutes’ stroll down the road from the Bank

“It is difficult to see,” wrote Michael Gillard in Britain’s Observer newspaper, “how the required high ethical standards [for BCCI to be allowed to operate in Britain] fit with BCCI pleading guilty to conspiring with its own officials and two representatives of Colombia’s Medellin drug cartel to commit tax fraud and launder the proceeds of cocaine sales.”

Robin Leigh-Pemberton, the Bank of England governor, neatly encapsulated London's see-no-evil offshore ethic. The present system of supervision, he added, "has served the community well.... If we closed down a bank every time we found an incidence of fraud, we would have rather fewer banks than we do at the moment."[12] That statement should have been evidence enough that the City of London was already the world's premier offshore center.

The full Price Waterhouse report on BCCI remains confidential today, on the grounds that this will disturb Britain's "international partners." It is a clear defense of tax haven London.[13]

Ever since then, Morgenthau has struggled to wake people up to offshore crimes, personally pressing four U.S. treasury secretaries to pay more attention, with little result. "I remember giving a speech a couple of years ago to talk about offshore banks. It put everyone to sleep,"[14] Morgenthau said. "Start talking about offshore money and their eyes glaze over."

Just as the BCCI scandal quieted down, another offshore tale was emerging in the oil-rich African state of Angola, where I was the Reuters correspondent. Jonas Savimbi's UNITA rebels had surrounded major towns in murderous sieges, pouring in mortar fire and trying to starve them into submission. In the city of Kuito desperate defenders were eating dogs, cats, and rats to survive, and bloodied patients were crawling from hospital beds to join armed raiding parties who would sneak out to search nearby fields, often mined, for cassava and other crops, sometimes having to fight their way back into town with provisions. The United Nations was calling it the world's worst war, and the government was under an international arms embargo, so in 1992 it turned to secretive French Elf networks—related to the ones I would later encounter in Gabon, as described in the prologue—to help secure arms supplies. A wealthy Russian-born Jew named Arkady Gaydamak put together some $800 million in financing to help Angola procure weapons from a Slovak company, repaid in Angolan oil money, via Geneva, and get around the embargo. Later, French magistrates probing these oil-for-arms deals heard from a participant that the arrangements were "a gigantic fraud . . . a vast cash pump," generating

a 65 percent margin on the biggest arms contracts."[15] The financing trails, of course, involved many tax havens.

I tracked Gaydamak down in Moscow in September 2005, where he was under an international arrest warrant for his so- called "Angolagate" deals.[16] He was eager to set the record straight and to discuss his efforts to—as he put it—bring peace to Africa and the Middle East[17] (just then he was embarking on what would be an ill-fated foray into Israeli politics).

Gaydamak had left the Soviet Union as a twenty-year-old in 1972, moving first to Israel, then to France, where he built up a translation business, mostly servicing Soviet trade delegations. "'Translator' means go-between," he explained. "If you are active in electronics, your position in the business world is usually with people in electronics. If you are a banker, you have relationships with bankers . . . but when you are a translator—a go-between—you know everybody."

In those early post-Soviet days Angola's leaders still looked to Russia as their big-power patron, but they had lost their bearings in a fast-changing Moscow. "I began to be an intermediary," he explained. "Russia was changing so quickly, everything was new: you should know where to go, how to go, how to organize. I was the so-called organizer of everything." Gaydamak became Angola's trusted man in Moscow. He knew that the big money lies in the "elsewhere" zone between jurisdictions, and in this context he gave me what must be one of the most "offshore" quotes of all time.

"In the so-called market economies, with all the regulations, the taxation, the legislation about working conditions, there is no way to make money," he said. "It is only in countries like Russia, during the period of redistribution of wealth—and it is not yet finished—when you can get a result. So that is Russian money. Russian money is clean money, explainable money. How can you make $50 million in France today? How? Explain to me!"

In other words, because Russian and international law is so full of holes, the money "redistributed" to a small oligarchy must be clean.

Some have compared the vast upward redistribution of wealth in Russia after the fall of the Soviet Union to the era of the robber barons in the United States in the nineteenth century. But there is a crucial difference. The U.S. robber barons didn't have a huge offshore network in which to hide their money. In spite of their many abuses, they concentrated on domestic investment. While they fleeced unwary investors and subverted the political process, they also built the

country's industrial prosperity. In time, the state was able to rein in their worst excesses.

But in the case of countries like Angola and Russia, the money simply disappeared offshore forever. African governments

have grown weaker and more dependent on aid from the very states that are also strengthening the offshore system. It was Africa's curse for her countries to gain independence at precisely the time that the purpose-built offshore warehouse for leaders' loot properly started to emerge. For many of these countries, "independence" really meant independence for African rulers from bothersome societies. In a sense independence was a pyrrhic victory: The colonial powers departed but quietly left the financial mechanisms for exploitation in place.

After the Cold War, Angola was in debt to Russia for about $6 billion, and in 1996 Gaydamak inserted himself into a deal to restructure the debt. The debt was shaved down to $1.5 billion and sliced into thirty-one promissory notes that Angola would pay back in oil, via a private company called Abalone, set up by Gaydamak and his business partner Pierre Falcone, with a UBS account in Geneva.[18] UBS was uncomfortable about the arrangements. "Any possible mention of one of the representatives of one or other of the parties," an internal UBS memo said, "in a newspaper article, even if a posteriori this is judged to be unfounded or indeed libellous, would not prevent, in the first instance, a Swiss or particularly Genevan judge taking an interest in the people mentioned."[19] But the deal went ahead.

Unfortunately for Gaydamak, a Swiss judge intervened in February 2001, after Angola had paid off just over half the promissory notes. The judge had found vast, mysterious flows of money out of Abalone, including over $60 million to accounts in Gaydamak's name, tens of millions more to accounts in the names of senior Angolan officials, and almost $50 million to a former Yeltsin oligarch.[20] But most of it flowed to an array of accounts in Switzerland, Luxembourg, Israel, Germany, the Netherlands, and Cyprus. Little or none of it seemed to have flowed to Russia's treasury. Gaydamak claimed that the Russian treasury got paid indirectly, via these mysterious accounts,[21] and added that this was a "classic trading operation, extremely favourable to us."

Because of the offshore secrecy, it is impossible to tell whether what Gaydamak said is even partly true. What is certain is that Angola's leaders, in partnership with Russian interests and private offshore intermediaries, cooked up a curious deal, routed offshore, with vast profits for some insiders, and with absolutely no chance of accountability to the people of Angola or Russia. The African insiders had used offshore to enrich themselves not from Angola's assets but from its debts.

The Swiss judge was later promoted away from the post, and his

replacement unblocked the notes in October 2003, arguing that neither Angola nor Russia had complained about the deal, and accepting the argument that the accounts held by the Angolan dignitaries amounted to "strategic funds, placed abroad in a time of war."

I could have chosen any number of murky African offshore episodes to explore, but I chose this one to illustrate a particular point about the scale of the draining of Africa's wealth. Gaymadak's deals represent only a tiny fraction of what the offshore system has drained from Africa. Two recent studies point directly to the sheer scale of the problem.

In March 2010 Global Financial Integrity (GFI) in Washington authored a study on illicit financial flows out of African countries.[22] Between 1970 and 2008, it concluded, "Total illicit financial outflows from Africa, conservatively estimated, were approximately $854 billion. Total illicit outflows may be as high as $1.8 trillion." Of that overall conservative figure, it estimates Angola lost $4.68 billion[23] between 1993 (when Gaydamak's main "Angolagate" deals started) and 2002, the year after his Abalone debt dealings ended. My personal belief, based on years of investigating Angola's economy and its offshore-diving leadership, is that Baker's estimate—equivalent to just over 9 percent of its $51 billion in oil and diamond exports during that time[24]—simply has to be a gross underestimate of the losses. Many billions have disappeared offshore through opaque oil- backed loans channeled outside normal state budgets, many of them routed through two special trusts[25] operating out of London.

GFI's shocking estimates complement the figures I mentioned in the prologue about the global scale of illicit financial flows: Developing countries lost up to a trillion dollars in illicit financial outflows just in 2006—that is, ten dollars out for every dollar of foreign aid flowing in.[26]

Another study emerged in April 2008 from the University of Massachusetts, Amherst, using different methodologies to examine "capital flight" from forty African countries from 1970 to 2004.[27] Its conclusions are similarly striking: "Real capital flight over the 35-year period amounted to about $420 billion (in 2004 dollars) for the 40 countries as a whole. Including imputed interest earnings, the accumulated stock of capital flight was about $607 billion as of end–2004." Yet at the same time, the total external debt of these countries was "only" $227 billion. So, the authors note, Africa is a net creditor to the rest of the world, with its net external assets vastly exceeding its debts. Yet there is a crucial difference between the assets and the liabilities. The

University of Massachusetts study concludes, “The subcontinent’s private external assets belong to a narrow, relatively wealthy stratum of its population, while public external debts are borne by the people through their governments.”

Having watched people die before my eyes in Angola; having seen an otherwise pretty six-year-old Angolan girl who, without access to basic medicine, was losing a fight with an infection that had rotted a hole in her cheek the size of a golf ball, I am seared by having witnessed some of the ways Africa’s people bear their public debts, in the forms of poverty, war, a hopeless lack of real opportunities, and the regular physical and economic violence perpetrated against them by corrupt and predatory offshore-roaming elites who float free and unaccountable above their societies. Raymond Baker, the director of GFI, was quite right to call the emergence of the offshore system “the ugliest chapter in global economic affairs since slavery.”[28]

In February 2003 Phil Gramm, a former Republican Texan senator who became vice chairman of the Swiss investment bank UBS Warburg, wrote to U.S. treasury secretary John Snow, arguing against a plan to increase international financial transparency. “This proposal will limit economic freedom,” he wrote, “and reduce the pressure that potential capital flight imposes on high-taxing countries worldwide.”[29] Illicit flows are good, Gramm was effectively saying, because it disciplines the victims.

Anyone who understands that there is a difference between wealthy rulers, who are the beneficiaries of illicit flows, and ordinary citizens, who are the victims, can see through Gramm’s position. Yet in whole sectors of the Western economics profession, such thinking has become almost an article of faith founded on the ageless blame-the-victim accusations that the losers are stupid, are corrupt, or just didn’t flagellate themselves hard enough.

Jim Henry, a former chief economist for McKinsey’s who is almost alone in having investigated this globally since the 1980s, sees the conventional roots of the global development crisis as “an economist’s fairy tale…. It leaves out all the blood and guts of what really happened.” Henry’s 2003 book Blood Bankers explores a number of shocking episodes where offshore banking led to crisis after crisis in low-income countries. First, bankers lent these countries far more than they could

productively absorb;

then they taught local elites the basics of how to plunder their countries' wealth, then conceal it, launder it, and sneak it offshore.

Then the IMF helped bankers pressure these countries to service their debts under threat of financial strangulation. Capital markets were deliberately opened up to foreign capital, according to Henry, "whether or not there were adequate security laws, bank regulations or tax enforcers in place."

He tracked down an American banker from MHT Bank who took part in a friendly private audit of the Philippines central bank in 1983. "I sat in a hot, little room at the Central Bank, added up what the Central Bank showed it had received from us on its books, and compared it with our disbursements," the banker told Henry.[30] "And nearly $5bn was just not there! I mean, it had just not come into the country. It had been disbursed by us, but it was completely missing from the Central Bank's books. It turned out that most of these loans had been disbursed to account numbers assigned to Philippine offshore banking units or other private companies. Apparently, the Central Bank gave MHT the account numbers, and we never questioned whether they were Central Bank accounts—we just wired the loans to them. And then they disappeared offshore."

Philippine officials realized what he was up to, and the following morning the banker got a big breakfast in his hotel room, courtesy of the management. Fortunately for him, he only had time to grab a bite of toast before heading to the airport. By the time he reached Tokyo he was sick, and on the flight home he went into convulsions and spent three days in a Vancouver hospital recovering from what the doctors said was "an unknown toxin."

Later, he told the New York Federal Reserve, and a friend at the National Security Council. "But apparently they just kept it to themselves," he said. "So the Philippines is still servicing all those Central Bank loans." Henry was able to confirm the banker's story on a later trip to the Philippines. He also dug up details on at least $3.6 billion of identifiable government-swallowed foreign loans that ended up with then-president Ferdinand Marcos and his closest associates.

Walter Wriston, the chief executive of Citibank from 1967 to 1984, described the thinking of many of the parties involved as private offshore banking emerged as a global force. Sitting before a picture of himself with President Marcos and his wife, Imelda (the picture, he said, "caused so much uncontrollable laughter among my colleagues that I've kept that picture on my wall all these years"), he described the pervasive

lack of understanding of, or perhaps the deliberate blindness of many toward, what was really going on. “In hindsight, the corruption and the amount of money bled off from those companies was a lot more than anybody knew about, including the United States government, Citibank, and the CIA,” he said. “We based our loans on economic analyses—will the power plant supply enough kilowatts to pay back its loan?—without realizing that we also had to account for the fact that the head of the power plant was the dictator’s brother.”[31]

As all this happened across the developing world, a pinstripe army of bankers, lawyers, and accountants lobbied inside the United States to make it increasingly attractive to these rising tides of dirty money, successfully turning it into a secrecy jurisdiction in its own right, just as the memo Michael Hudson received in 1966 had suggested. Meanwhile, they continued to capture the legislatures in small tax havens to perfect the global dirty-money system. Playing all three corners of the dirty-money triangle—the source countries being drained of illicit wealth, the increasingly offshore-like economies receiving the wealth, and the offshore conduits handling its passage—turned global private banking into one of the most profitable businesses in history. “The rise of Third World lending in the 1970s and 1980s,” in Henry’s description, “laid the foundations for a global haven network that now shelters the world’s most venal citizens.”

Henry’s calculations suggested that at least half of the money borrowed by the largest debtor countries flowed right out again under the table, usually in less than a year, and typically in just weeks. The public debts were matched almost exactly by the stock of private wealth their elites had accumulated in the United States and other havens, and by the early 1990s there was enough flight wealth in Europe and the United States to service the entire debt of the developing world—if only its income were taxed modestly. For some countries, like Mexico, Argentina, and Venezuela, the value of the elites’ offshore illicit wealth was worth several times their external debts. Today the top 1 percent of households in developing countries owns an estimated 70 to 90 percent of all private financial and real estate wealth. The Boston Consulting Group reckoned in 2003 that over half of all the wealth owned by Latin America’s wealthiest citizens lay offshore. In June 2010 Henry reckoned that the total stock of flight capital financial wealth from developing countries in 2007 had reached $7–8 trillion—more than half under the custody or management of the world’s top 50 banks.

One U.S. Federal Reserve official noted: “The problem is not that

these countries don't have any assets. The problem is, they're all in Miami."

In 1982 Mexico's President José Lopez Portillo gave a speech to parliament, outlining the offshore challenge facing his continent. "The financing plague is wreaking greater and greater havoc throughout the world," he said. "It is transmitted by rats and its consequences are unemployment and poverty, industrial bankruptcy and speculative enrichment." He blamed "a group of Mexicans . . . led and advised and supported by the private banks that have taken more money out of the country than the empires that exploited us since the beginning of time."[32]

Lopez Portillo vowed to ignore the IMF, nationalize the banks, and introduce exchange controls, and within ten days an alliance of bankers, businesspeople, and conservative Mexicans had made him back down. The IMF and the Bank for International Settlements, in Switzerland, ignoring Mexico's offshore flight wealth, ordered Mexico and other debtor nations to "put your house in order."

The economist Michael Hudson describes how he was hired in 1989 by a Boston money management firm to organize a sovereign debt fund investing in the government bonds of developing nations.[33] Huge risk premiums then meant that Argentine and Brazilian dollar bonds were yielding almost 45 percent, while Mexican bonds were yielding 25 percent. In its first year the fund, incorporated in the Netherlands Antilles, became the world's second best performing fund of its kind.

Hudson found out what was happening. "The biggest investors were political insiders who had bought into the fund knowing that their central banks would pay their dollar debts despite the high risk premiums," he said. Some of the biggest investors were people in top positions in central banks and presidencies. "We realized who has all the Yankee dollar claims on Latin America," he said. "It was local oligarchies with offshore accounts. The dollar debt of Argentina in the early 1990s was owed mainly to Argentineans operating out of offshore banking centers. The major beneficiaries of foreign debt service were their own flight-capitalists, not bondholders in North America and Europe."

This kind of simple trick is routinely practiced by so-called "vulture funds." Wealthy foreign investors buy up distressed sovereign debt at pennies on the dollar—typically at a 90 percent discount—then reap vast profits when those debts are repaid in full. The trick is to make sure that influential local government officials are secretly part of the investor group buying the discounted debt—ensuring that these local

investors will do battle inside the developing country governments to make sure the debts get paid. Their involvement, of course, is hidden behind a shield of offshore secrecy, so an impoverished nation's

citizens need never find out about the wealth that has been stolen from them or how the investors did it.

Economists have not ignored these issues entirely, but they almost always break them down into discrete, country-level local problems that only blame corrupt local elites. These matter, of course, but such analyses obscure what all the disasters have in common: offshore.

And when offshore erosion has been considered, it has been taken as an inconvenience, to be addressed with Band-Aids. As one IMF report put it: "Offshore banking has most certainly been a factor in the Asian financial crisis. A special effort is therefore needed to help emerging economies . . . to avert financial crises through dissemination of internationally accepted prudential and supervisory standards."[34]

The IMF is arguing here in an illogical circle. By helping local elites effectively place themselves above the law and creating new temptations to mischief, the offshore system entirely neuters the chance of prudent regulation and supervision that is needed to protect those countries against that very same offshore system. Imagine if those elites had to keep their money bottled up at home, or at least account for their wealth, pay appropriate taxes on it, and submit to appropriate laws. Very soon they would understand why good government is directly in their interest.

Perhaps the saddest part of all this is that it should have been obvious to anybody who gave it a moment's thought.

The stories in this chapter have been mostly about illicit financial flows drained from developing countries and into tax havens, undermining incentives for local elites to strive for better government by allowing them to remove themselves from the problems of their home countries, building safe offshore stashes that insulate and protect them against the turmoil and poverty that surrounds them. There is one more element to consider that is related to, but not the same as, the illicit offshore money. That element is tax.

Tax is the most sustainable, the most important, and the most beneficial form of finance for development. It is not just a question of revenue: Tax makes rulers accountable to their citizens, not to donors. As Kenya revenue commissioner Michael Waweru put it: "Pay your taxes, and set your country free." Tax helps countries build good government in two broad ways. First, as citizens bargain with their

rulers over tax, a social contract develops between them, helping foster representative democracy. Second, the imperative to raise tax revenue stimulates the building of institutions to do so. It strengthens state capacity.

This "no taxation without representation" formula is never perfect or even close to perfect, but historians recognize it as a cornerstone, over the very long term, of the development of democracy and representative government in the developed world. Until very recently, almost nobody spent time wondering whether this formula might work in developing countries too. The answer, instead, has been to send foreign aid.

Developing countries, by and large, have very low tax revenues, and the dynamics of tax and state-building have often been weak. Where tax revenues are high, it is often because the country is a mineral producer: These kinds of revenues make rulers accountable more to oil companies than to their citizens and fail to build accountability. Yet Africans today increasingly understand the importance of tax in their developing countries. "I have made revenue collection a frontline institution because it is the one which can emancipate us from begging," said Yoweri Museveni, the president of Uganda, which collects taxes worth only about 11 percent of GDP. "If we can get about 22 percent of GDP we should not need to disturb anybody by asking for aid; instead of coming here to bother you, give me this, give me this, I shall come here to greet you, to trade with you."[35]

Tax havens, of course, overturn the healthy dynamics by providing escape routes for their elites. It is worth briefly exploring some of the ways in which poor countries are drained of tax money through operations that, even when of questionable legality, are rarely challenged. This brings us back to the story about how countries allocate taxing rights between them.

Since the 1920s, when the League of Nations tried to get countries to agree how they would divide up the tax revenues on incomes from the various operations of multinationals, a big question has been at play. Do most of the taxing rights go to the "source" country that hosts inward investment from a multinational based in another country, which is the source of the income in question? Or do they go to the "residence" country—the multinational's home country, where it is resident?

Capital-rich countries like Britain that hosted a lot of multinationals investing overseas wanted rules giving most taxing rights to "residence" countries, while the "source" countries receiving inward investment—often poorer countries—wanted to tax the investors' income locally, at

the source. The agreements were eventually laid out in bilateral tax treaties between countries, but these treaties were heavily influenced by the prevailing models. The rich countries, led by the OECD today, have pushed for a model skewed in favor of themselves, while the United Nations favors a model that shifts taxing rights toward "source" countries, typically poorer ones.

No prizes for guessing which model has come to dominate the field of international tax. When the United Nations produced a draft model tax treaty in 1980 that was supposed to shift the balance back in favor of "source" taxation and developing countries, the OECD intervened aggressively to stop this: not only by ensuring that its own model treaty benefiting rich countries remained the preferred standard, but also by interfering at the United Nations to weaken its model. John Christensen, a former economic adviser to the British Crown Dependency of Jersey, remembers a meeting of the United Nations Tax Committee in Geneva in 2008 when Britain's representative suddenly stood up and began speaking, in what looked like an intervention coordinated with the representative from Liechtenstein. "He kept on interrupting," Christensen said. "It was a general assault on developing countries being better able to represent their interests, about providing more resources to the UN Tax Committee. He was the cheerleader. Twice the chair had to tell him 'please let us speak.' People there were really angry with him: we could all see he was blocking progress to protect the UK's and the United States' interests."

The rich countries' model is dominant today. Not only has this problem of double nontaxation of multinational corporations been allowed to happen, but billions of dollars in tax that would in a fairer world be paid in poor countries is paid in rich countries instead, quite legally.

It is worth briefly examining another role played by tax havens in the weird and wonderful world of international tax that enables companies to knock out their tax bills. Let's say a German bank or company invests in Tanzania. Under a tax treaty between Germany and Tanzania, the African country may well agree not to tax the company's local earnings for fear that otherwise German companies will simply invest elsewhere. But now even with this treaty in place, the German corporation has not solved its problem yet. The treaty may have knocked out the Tanzanian tax charge on the company's earnings, but if it sends these untaxed earnings straight back to Germany they will still be taxed there. So it sends the earnings to a so-called conduit or treaty haven, which will have a wide network of treaties, including one with Tanzania. The treaty

haven also agrees

not to tax these untaxed earnings: What has happened here is that the haven serves as a stepping-stone for these profits to emerge, along carefully constructed tax-free pathways, out from Tanzania and into the wider world, often via yet another haven where the income will not be taxed at all.

"Like two closely marked football players passing the ball to a third one who is unmarked," explains Professor Sol Picciotto, a tax haven expert, a conduit haven "can create major gaps in the defenses of tax authorities." In this case both Tanzania and Germany are deprived of tax revenues, courtesy of offshore. And this is quite legal. Many tens, and potentially hundreds, of billions of dollars of tax revenue are at stake in this game, vastly increasing the hunger for foreign aid among the world's poorer nations. South Africa's finance minister Trevor Manuel put the problem neatly. "It is a contradiction to support increased development assistance yet turn a blind eye to actions by multinationals and others that undermine the tax base of a developing country."[36]

Over twenty-five hundred tax treaties are in place around the world—an extensive but very poorly understood counterpart of the global trading and investment regime.

The Netherlands, with a wide network of tax treaties, is a good example of a treaty haven. The two biggest sources of foreign investment into China in 2007 were not Japan or the United States or South Korea but Hong Kong and the British Virgin Islands.[37] Similarly, as of 2009 the biggest source of foreign investment into India, at over 43 percent of the total, is not the United States or Britain or China but the treaty haven of Mauritius, a rising star of the offshore system.[38] And here lies another odd tale.

Mauritius illustrates how the British spiderweb is no imperial relic but a modern and self-renewing system. Although French- speaking, the country has a long history of British colonial involvement.[39] Mauritius set up its offshore center in 1989 under the tutelage of experts mostly from the City of London, Jersey, and the Isle of Man. Rudolf Elmer, who worked as a senior offshore practitioner in Mauritius from 2006 to 2008 for Standard Bank, says he trained in Jersey and the Isle of Man before being sent to Mauritius. "There is a lot of British influence," he said. "Major banks like Barclays and HSBC have built up major operations and multistory buildings in Cyber City south of Port Louis [the capital]. Six years ago there were only five. Today, I estimate about 40. It is a hot spot: it will become very prominent."[40]

Though formally independent, Mauritius is a member of Britain's Commonwealth, and its final appeal court is the Privy Council in London. Having gotten over a shaky period in the 1980s, Mauritius is now politically stable and boasts a cheap, well- educated, and multilingual labor force, and it is in the perfect time zone to serve Europe, Asia, and Africa. With over 40 tax treaties with countries in those three continents, Mauritius is a fast-growing conduit haven for investment into India and for investment into Africa from China and the City of London.

Mauritius also specializes in "round-tripping." In this practice a wealthy Indian, say, will send his money to Mauritius, where it is dressed up in a secrecy structure in order to disguise it as foreign investment before it is returned to India. Because of the treaty, the wealthy Indian can avoid Indian withholding taxes on local earnings and use the secrecy to do nefarious things—such as constructing a local market monopoly by disguising the fact that a seemingly diverse and unrelated array of competitors in a market is in fact controlled by the same interests. The construction of secret monopolies via offshore secrecy seems pervasive in certain sectors and goes some way toward explaining why, for example, mobile phone charges are so high in some developing countries.

Local elites lobby for these treaties despite the harm they can cause. "The India treaty with Mauritius is a pure treaty- shopping treaty," said David Rosenbloom, a U.S. tax expert. "Why do the Indians tolerate it? We, the United States, have a treaty with Bermuda, which is ridiculous: Bermuda doesn't even have a tax system. Countries do bizarre things. A lot of it is political. It defies rational thought."[41]

RESISTANCE
In Combat with the Ideological Warriors of Offshore

IN APRIL 1998 THE ORGANISATION FOR ECONOMIC Co-operation and Development, a club of rich countries that includes the world's most important secrecy jurisdictions, made an astonishing admission: Tax havens cause great harm. Tax havens and associated offshore activities, an OECD report acknowledged, "erode the tax bases of other countries, distort trade and investment patterns and undermine the fairness, neutrality and broad social acceptance of tax systems generally. Such harmful tax competition diminishes global welfare and undermines taxpayer confidence in the integrity of tax systems."[1]

Offshore is not only a place, a system, and a process, but it can also be considered as a collection of intellectual arguments. Through the OECD's new project—the first serious and sustained intellectual assault on the secrecy jurisdictions in world history[2]—I will explore the main arguments made by the defenders of the offshore system.

At the time the OECD project got under way, worldwide protests were rampant against the obvious failures of globalization. Yet campaigners, who focused many of their arguments on trade, all but ignored the offshore system. The OECD's new initiative, which contained a lot of baffling discussion about international tax, hardly registered on the protesters' agendas.

The new report was allowed to emerge for several reasons. First, the evidence had become impossible to ignore: The use of tax havens was "large, and expanding at an exponential rate," as the report put it. Second, the report was aimed mostly at small Caribbean islands that were not OECD members, and it glossed over the role of OECD countries in offshore.[3] Also, several OECD countries that were not tax havens pushed the report hard inside the OECD. But there is another important reason why the OECD report got through: Tax havens are so steeped in indifference to big inter-governmental bodies that although the OECD

had flagged the report for two years, almost nobody offshore had paid it enough attention to mount a serious effort to stop it from emerging.

John Christensen was in Jersey when the 1998 report came out. "Virtually nobody there took it seriously except me," he said. "Bankers were saying 'OECD who? Isn't that some sort of customs organization?'" Daniel J. Mitchell of the right-wing Heritage Foundation, in Washington, D.C., one of the secrecy jurisdictions' most vocal supporters, had a similar reaction to the Paris- based OECD. "I thought 'Ah, just a bunch of crazy European socialists.'"[4]

Still, Mitchell decided to write a couple of things on it for the Heritage Foundation and began to see that this mattered. And the OECD's follow-up report in 2000 contained a primed bomb: a blacklist of 35 secrecy jurisdictions, and a threat of "defensive measures" against havens that did not shape up. More alarming for Mitchell, it was not only the "European collectivists" who backed the OECD, but the Clinton administration too.

"Our side was caught with our pants down," Mitchell said in an interview in Washington, D.C. "Heritage, a big full-service think tank, doesn't focus on just one thing. I thought we ought to have a group to have a go at this." So he got together with Andrew Quinlan, a friend from college, and Veronique de Rugy, a Paris- educated libertarian academic, to create a small outfit called the Center for Freedom and Prosperity (CF&P) with a subgroup, the Coalition for Tax Competition, whose aim was to protect "the cause of tax competition." They lodged it at the Cato Institute, a well-funded free-market think tank in Washington.

The antitax atmosphere in Washington in those days was poisonous. A Delaware senator, William Roth, had been whipping up a hate storm against the U.S. Internal Revenue Service under a declared Republican strategy to "pull the current income tax code out by its roots and throw it away so it can never grow back."[5] In an effective piece of political theater, Roth, a manic supporter of tax cuts for the wealthy, got IRS agents to testify at hearings behind screens like mobsters, with their voices electronically distorted. His people regaled the hearings with stories about IRS agents in flak jackets storming houses and forcing teenage girls to change clothes at gunpoint—and the IRS had no right of reply. No matter that most of these claims were untrue.[6]

Mitchell began to bombard politicians with emails about the OECD reports, to write scary op-eds in national newspapers with headlines such as "Global Tax Police," and to insult the OECD publicly. Hostilities

had begun in the offshore world's first big battle of ideas.

To understand the intellectual underpinnings of offshore finance, it seems appropriate to start with Mitchell, one of the secrecy jurisdictions' noisiest and most active defenders.

He is a man of striking warmth and great personal charm. In his blog "International Liberty: Restraining Government in America and around the World," he declares, "I'm a passionate Georgia Bulldog," in reference to the mascot of the University of Georgia's gridiron team, "so much so that I would have trouble choosing between a low-rate flat tax for America and a national title for the Dawgs. I'm not kidding." In his blog he notes that Britain's left-of-center Observer newspaper called him a "high priest of light tax, small state libertarianism" and that this was "the nicest thing anyone's ever said about me."

Mitchell began to take a serious interest in politics in the Reagan era, emerging from George Mason University fascinated by conservative economists such as James Buchanan and Vernon Smith, who explored a branch of economics known as Public Choice Theory, which rejects notions that politicians act on behalf of people or societies and instead looks at them as self- interested individuals. Its followers' distaste for government dovetailed with Mitchell's budding libertarian outlook and his love for Reagan. He worked with Republican Senator Bob Packwood, then for the Bush/Quayle transition team, before joining Heritage.

His libertarian vision is of a world where government is pared back to just a few core roles, such as providing security, leaving the rest to the market. "Some people fantasize about supermodels," he said. "I fantasize about having government at five percent of GDP." (This is quite an ambition: Currently, most OECD governments take in tax revenues equivalent to 30 to 50 percent of GDP.) During our interview he retreated several times behind a personal disclaimer along these lines: "I just work

with theories; I have not worked in the real world of business."

Mitchell's specialty is a tone of calculated, arched-eyebrows incredulity when discussing people or ideas that he disdains, and his sound bites are carefully crafted to appear utterly reasonable. His short, peppy little Internet videos are clear, simple, and striking in their directness, and he sprinkles them with homespun wisdom, along with repeated references to freedom and liberty and digs at his adversaries—"international bureaucrats," "intrusive governments," and "Europeans" (especially the French, his particular bogeys)—uttered in tones of theatrical horror.

"Let me give you some frightening numbers," Mitchell said in a bouncy presentation to a "Freedom Conference" at the antitax Steamboat Institute in Colorado in August 2009. Citing a seventy-five-year projection that raised the specter of whopping tax increases, and reeling off statistics about the free-spending habits of George W. Bush (whom he dislikes), he predicted that "we will have a bigger government than any European welfare state—even France and Sweden…. I don't know if that means we have to stop using deodorant and train our army to surrender if there's a war, but we are going to be a European welfare state."

Before the OECD report emerged, Mitchell said he did his best to avoid international tax. "My bread and butter was fiscal policy issues: tax cuts versus tax increases; that kind of thing," he said. "For me, international tax—transfer pricing, interest allocations, and so on—was almost as bad as excise taxes on milk in Mongolia."

In those days there was no real ideology for tax havenry: Few people understood how important the offshore system was becoming, and in the age of rapid globalization, almost nobody questioned it. Fortunately for Mitchell, the OECD had tried to avoid looking like it was victimizing smaller jurisdictions by couching its initiative not so much as an attack on tax havens but as an attack on harmful tax competition—the race to the bottom between states to attract footloose capital by offering zero taxes and other lures. This focus gave Mitchell an immediate advantage in Washington, letting him complain that the OECD was a big bureaucracy that opposed competition.

This question of "competition" is one of the main arguments that tax havens deploy to justify their existence, and it is well worth exploring. Mitchell articulates these arguments as well as anybody.

"International bureaucracies and politicians from high-tax nations are launching a co-ordinated attack against these jurisdictions. The high-tax nations of the world want to set up something equivalent to

OPEC," he thundered, flashing up pictures of sinister-looking men in Arab headdresses. "It is an effort by high-tax nations to form a cartel that will enable the politicians to put in place worse tax policies."[7]

"Say you only had one gas station in a town," he continued in a recent presentation.[8] "That one gas station could charge high prices, it could maintain inconvenient hours; it could offer shoddy service. But if you have five gas stations in a town, all of a sudden those gas stations need to compete with each other: They have to lower prices, they have to be attentive to the needs of consumers. We see the same thing internationally, with governments."

He went further. "Imagine you are a governor of Massachusetts. You'd love to shut down New Hampshire—because it's competition. Obama and the rest of the collectivists on the left hate tax havens because they are outposts of freedom. Because of globalization, labor and capital are a lot more mobile than they used to be. If governments are trying to impose high tax rates, [people] actually have options to move either themselves, or their money, across borders. Just like if you have one monopoly gas station in town, and all of a sudden new gas stations open up, you can decide, 'I'm no longer going to shop at that gas station that was ripping me off; I can shop at the gas station that is actually giving me a better deal for my money.'" In other words, the argument goes, tax competition is beneficial, and you can't fight it anyway.

At first glance, these arguments seem reasonable. But look closer, and they collapse in a puff of nonsense. Here's why. Competition between companies in a market is absolutely nothing like competition between jurisdictions on tax. Think about it like this: If a company cannot compete it may fail and be replaced by another that provides better and cheaper goods or services. This "creative destruction" is painful, but it is also a source of capitalism's dynamism. But what happens when a country cannot "compete?" A failed state? That is a very different prospect. Nobody would, or could, as Mitchell put it, "shut down New Hampshire." What does it actually mean for a country to be "competitive"? Governments obviously do not "compete" in any meaningful way to police their streets. They do, perhaps, compete to educate their citizens better, but this kind of "competition" points to higher taxes to pay for better education.

The Geneva-based World Economic Forum (WEF) provides a more comprehensive answer, defining competitiveness as "the set of

institutions, policies and factors that determine the level of productivity of a country." It uses 12 competitiveness "pillars," including infrastructure, institutions, macroeconomic stability, education, and efficiency of goods markets. One could quibble with the categorizations, but taken together they form a sensible enough selection. Most of them require raising appropriate levels of tax.

It turns out, in fact, that the most "competitive" countries on the WEF's measure are the higher-tax countries. There is plenty of variation, of course: Sweden, Finland, and Denmark, the world's three highest-taxed countries, were ranked fourth, fifth, and sixth most competitive in the 2009–10 index, while the United States, with lower (but still not very low by world standards) taxes, is second. But the really low-tax economies like Afghanistan and Guatemala are the least competitive.

Dig further into the data, and other interesting facts emerge. Countries that spend a lot on social needs—something Mitchell opposes—score best on the competitiveness scale."[9] Higher taxes help countries spend more on education, health, and other things that help their workers "compete."

What applies to tax applies to laws and regulation too. What does it mean for a jurisdiction to have a "competitive advantage" in being a heroin smuggling entrepôt or offering lax enforcement on child sex tourism? It may bring in revenue, but in the sense that countries do "compete" with others, it can clearly bring great harm.

Mitchell's world of beneficial tax competition emerges from a sub-school in economics that clings to a 1956 paper by the economist Charles Tiebout, who explored what happens (only in theory, you understand) when markets are perfect and free citizens flee in hordes from one jurisdiction to another at the drop of a tax inspector's hat. This is not, of course, how the world works—but libertarians and defenders of tax competition stretched Tiebout's ideas like rubber to make their intellectual shield for the havens. Mitchell also points to lists of secrecy jurisdictions, claiming they tend to be wealthier than other jurisdictions, and takes this as evidence that offshore is a good thing. This is like an argument that points to the private jets, yachts, and palaces owned by a rich dictator and his cronies as evidence that corruption generates wealth. Well, it does, in a way, but "generating" this kind of wealth is not exactly what we should aim for.

Yet there is one area where Mitchell is probably right. Tax rates have been tumbling for years around the world: Average

corporate tax rates, for example, fell from nearly 50 percent in 1980, Mitchell says, down to just over 25 percent today. This is, in large part, the result of tax competition between jurisdictions and with tax havens as the sharp edge of the ax. “When I go in for my salary review, I always say it’s because of the great papers I write for Cato that is forcing governments all over the world [to cut taxes],” Mitchell says. “But the real story is tax competition . . . and tax havens are the most powerful instrument of this tax competition.”

It is a hard point to prove, but it is reasonable to think that while the world has fixated on ideas and ideologies as the driving force behind global tax-cutting and financial deregulation, tax competition may have been the bigger force.

Many economists see this as a nonstory, though. Although tax rates have fallen, tax revenues have been fairly steady. Since 1965 personal income taxes in rich-world OECD countries have remained remarkably stable at 25 to 26 percent of the total tax haul,[10] and total corporation taxes have even risen slightly, from 9 to 11 percent. Some say this proves that tax competition does not matter. But look behind the numbers, and an unhappier picture emerges.

Though rich countries have preserved their overall tax revenues, corporations and rich folk have paid much less as a share of revenues. Corporate profits, on which their tax liabilities are assessed, have increased sharply.[11] Meanwhile, the rich have not only seen their wealth and income soar, but they have shifted their income out of “personal income tax” categories and into “corporation tax,” to be taxed at far lower corporate tax rates. For example, the richest four hundred Americans booked 26 percent of their income as salaries and wages in 1992 and 36 percent as capital gains. By 2007 they only recorded 6 percent as income and 66 percent as capital gains.[12] The same has been happening across all high-income categories and in all OECD countries since at least the 1970s. So falling corporation taxes are being masked by rich people’s tax dodges.[13] The working population has seen its personal income taxes and social security contributions rise over the last 30 years, as their wages have stagnated. Mitchell is right to say that tax competition is real, and it bites.

Look at how tax competition smites developing countries, and a bigger story emerges.

One of the only studies ever made was a short IMF paper in 2004[14] that notes how little attention has been paid to how international tax

competition has been affecting developing and emerging-market economies and takes what it calls a "first look at those issues."

Its results are remarkable. Tax rates have fallen at least as fast as in rich countries, if not faster, and furthest of all in sub- Saharan Africa. But tax revenues fell sharply too: Just in the short 11-year period from 1990 to 2001, corporation tax revenues in low-income countries fell by a quarter. This is especially troubling because developing countries find it much easier to tax a few big corporations than to tax millions of poor people, so corporate taxes are a bigger deal for them.

One reason for the falling corporate tax revenues has been special tax incentives. In 1990, only a small minority of poor countries offered these incentives; by 2001 most of them did. The IMF's first detailed study on this in July 2009 concluded[15] that these tax incentives, which are supposed to attract foreign investors, slash tax revenues but do not promote growth.[16]

As I have mentioned, tax, not aid, is the most sustainable source of finance for development. Tax makes governments accountable to their citizens, while aid makes governments accountable to foreign donors. Tax competition is destroying developing countries' tax revenues and making them more dependent on aid. Brazilians talk about tax competition in terms of a guerra fiscal—a tax war—a term that reveals far better what is really happening here and echoes the words of U.S. Senator Carl Levin when he says tax havens are "engaging in economic warfare against the United States and honest, hardworking Americans."

Mitchell has another presentation he likes to make: what he calls "The Moral Case for Tax Havens."[17] A video from October 2008 gives a flavor.

"The vast majority of the world's population lives in nations where governments fail to provide the basic protections of civilized society," says Mitchell (cue pictures of Kim Jong-Il, Robert Mugabe, and Vladimir Putin, looking sinister). "Tax havens protect these people from venal and incompetent governments by providing a secure place to hide their assets.

"One reason why Switzerland has such an admirable human rights policy of protecting financial privacy is that they strengthened their

laws in the 1930s to help protect German Jews wanting to guard their assets from the Nazis." (Cue grainy pictures of Hitler saluting from a staff car and a Gestapo officer rounding up frightened women.) "And what about the Argentine family," he continues, "and the risks that their life savings are wiped out by devaluation?" Put it offshore, he says, and the money is safe.

Again, his arguments are persuasive—right up to the point where you stop to think about them.

First, the story about the origins of Swiss bank secrecy is no more than an appealing fiction. The argument about it being set up to protect Jewish money first appeared in the November 1966 Bulletin of today's Credit Suisse. It wasn't true. The reason bank secrecy was strengthened in 1934 was a scandal two years earlier when the Basler Handelsbank was caught in flagrante facilitating tax evasion by members of French high society, among them two bishops, several generals, and the owners of Le Figaro and Le Matin newspapers. Before that, there was professional secrecy (such as exists between doctors and their patients), and violation of this secrecy was a civil offense, not a criminal one as it is today.[18] The law had nothing to do with protecting Jewish secrets.

Next, if a country is misruled, why should it only be the wealthy elites who get to protect their money by going offshore? If a country has unjust laws, then providing an offshore escape route for its wealthiest and most powerful citizens is the best way to take the pressure off the only constituency with real influence for reform. Keep their money bottled up at home, and pressure for change would come fast. Even then, there is no need for offshore secrecy to protect your money. If I am a Tanzanian with a million dollars in London earning 5 percent, and I ought to pay tax on that income at 40 percent, then I owe my government twenty thousand dollars in taxes for that year. I should pay that. Britain could tell my government all about my money, but that would give Tanzania no power under any international agreement to "confiscate" my million dollars. An Argentine family can protect its money from hyperinflation by shifting it to Miami—but secrecy plays no part in this protection. Put it in a normal bank account, exchange the information on the income, and pay tax on it. The principal remains quite safe.

On the question of people needing to protect their cash from tyrants, Mitchell might like to answer this. Who uses secrecy jurisdictions to protect their money and bolster their positions? The human rights activist, screaming in the torturers' dungeons? The brave investigative journalist?

The street protester? Or the brutal, corrupt, kleptocratic tyrant oppressing them all? We all instinctively know the answer.

Ah, but, Mitchell then retorts. “Your personal data may be sold to kidnappers who then grab one of your kids.” Transparency threatens homosexuals in Saudi Arabia and Jews in France “victimized by corrupt and/or despotic governments. Without the ability to protect their assets in so-called tax havens, these people would be at even greater danger.” The answer, he says, is to “place your money in a bank in Miami, since America is a tax haven.”[19]

This one carries a shading of truth—but no more. Kidnappers don’t need tax data to know that someone has money. And the very wealthy have bodyguards and are relatively rarely kidnapped: The lower and middle classes are usually the victims. More importantly, though, good tax systems promote better governance (and hence less kidnapping), as all the research indicates. By helping elites loot their countries, secrecy jurisdictions are causing exactly the problems Mitchell says he is worried about.

And then we get to the question of freedom. Mitchell is quite clear about his views. The high-tax welfare state, he says, is “a prison for the human soul. It’s making pets out of all of us. It’s going to put us in a little cage, control our freedom, control our lives—that’s what we need to fight against.” Tax is bad, and tax havens are the answer.

In this worldview personal property is inviolable, and tax is theft. “It makes sense,” Mitchell says, “to protect your family’s interest by putting your money someplace like Hong Kong, where the politicians from your country can’t find out about it. And if they can’t find out about it, they can’t steal it.”

Leaving aside the question of whether or not this is a general incitement to criminal tax evasion, it is worth asking if tax is th eft .

Property rights, as the philosopher Martin O’Neill points out, emerge from a general system of legal and political rules that includes the rules of taxation. To say tax is theft, then, is to use a system of which tax is a central part as your weapon against taxation. It is to argue in an illogical circle.

Corporations, too, emerge from states, legally speaking. “The state is the only institution in the world that can bring a corporation to life,”

explains Joel Bakan in his best-selling book The Corporation. "It alone grants corporations their essential rights, such as legal personhood and limited liability.... Without the state, the corporation is nothing. Literally nothing."[20] To say that corporation tax is theft is, again, simply illogical.

You can find any number of other illogical eddies, ironies, and contradictions in the world of offshore. Secrecy jurisdictions routinely say their role is to promote efficiency in financial markets—but the cloak of secrecy they provide directly contradicts the idea of efficient markets, which require transparency. In an article entitled "Why Do I Have to Deal with People Like Dan Mitchell?"[21] the University of California, Berkeley, economist Brad deLong points to several of Mitchell's articles—including one praising Iceland for its tax-cutting, deregulated economic policies, just before Iceland's economy collapsed, and one entitled "A Better Way to Chastise France," urging the United States to eliminate withholding taxes on all dividends paid to foreigners, so as to suck tax-dodging capital out of "oppressive high-tax nations." So Mitchell contradicts himself: Tax havenry does "chastise" other nations after all.

Monetary policy is another case where offshore cheerleaders find themselves confused. Generally, these cheerleaders have supported the Monetarist doctrine, which argues that you tackle inflation and unemployment by managing the quantity of money. Yet it is ironic that this doctrine began its rise with a paper by Milton Friedman in 1956, the very year when the offshore Eurodollar market and the offshore system properly took off. But the offshore system directly undermined monetarism: In a world where capital flits effortlessly to unregulated offshore worlds, and where banks can create money willy-nilly, governments struggle to control their money supplies. "The use of quantity of money as a target," Friedman himself finally conceded in 2003, "has not been a success."

Tax avoidance is another case in point. Tax havens endlessly promote themselves as delivering "tax efficiency" to corporations—but this tax avoidance is inefficient. "If tax abuse is needed to ensure an investment is viable," notes the accountant Richard Murphy, "it's a misallocation of resources to do it."

Another offshore antitax favorite is the old claim that tax cuts actually raise revenue partly because people will be less inclined to dodge taxes. Therefore tax competition, driving down tax rates, must be a good thing. This has been bundled together in many Republican minds with another big idea embraced by the antigovernment libertarian world

of offshore: It is essential to cut taxes to starve the beast of big government. Or, as the antitax zealot Grover Norquist memorably put it, government should be cut "down to the size where we can drown it in the bathtub."[22] There is a problem with all of this, of course. Many people think tax cuts boost revenue. Starve-the-Beast-ers think tax cuts are useful ways to cut revenue. They can't both be right. Bob McIntyre of Citizens for Tax Justice explains how he thinks the two conflicting theories have thrived side by side for over a quarter of a century. "It's simple," he said. "On Mondays, Wednesdays and Fridays Republicans say that cutting taxes raises revenues. On Tuesdays, Thursdays and Saturdays they say cutting taxes reduces revenues so much that it forces government to cut back—to starve the beast. And on Sundays they rest." In truth, most serious analysts don't believe that tax rates, on their own, make all that much difference. Obviously, real businesspeople invest and hire workers where there is demand for their products, strong infrastructure, and a healthy and educated workforce. Most studies show that corporate tax rates are a relatively minor factor in business location in most areas of business. Tropicana won't grow oranges in Alaska just because it is offered a tax break there. In the golden age of 1947–73, the U.S. economy grew at nearly 4 percent a year—while the top marginal tax rate varied from 75 to over 90 percent.[23] I am not arguing that those tax rates caused that growth. But high taxes clearly don't need to choke off growth.

And if tax cuts are the answer to reducing tax evasion, as Mitchell suggests, then he might like to explain the great global eruption of international tax evasion, not to mention the sudden plague of capital flight, from the 1970s onward—just as tax rates went into freefall worldwide.

Here is the real story: As tax havenry exploded and finance became freer, tax evasion and capital flight followed.

By 2000, as the OECD project on tax havens' harmful tax competition rolled forward, Mitchell and his allies began to firehose Washington with letters, emails, and presentations. Almost nobody was articulating the counterarguments.

The OECD was soon on the defensive. Then the havens themselves began to mobilize. In January 2001 the secretary general of the British Commonwealth invited the OECD to set up a joint working

group, with equal representation for small member states (that is, the tax havens). This group began to festoon the OECD in red tape, and the whole project got bogged down in arcane haggling. The havens also set up a body called the International Tax and Investment Organisation to coordinate

defenses, and they linked up with Mitchell and the Center for Freedom and Prosperity.

Then George W. Bush came to power.

Until then, President Clinton's treasury secretary, Larry Summers, had backed the OECD, even proposing sanctions against the havens in his last budget. Bush's first treasury secretary, Paul O'Neill, initially seemed unsure about the issue, even saying, to Mitchell's alarm: "I support the priority placed on transparency and cooperation."

The Center for Freedom and Prosperity ramped up the pressure. They organized eighty-six congressmen and senators, including big hitters like Jesse Helms and Tom DeLay, to urge O'Neill to ditch the OECD's project. Milton Friedman, James Buchanan, and other conservative economists signed on. Letters flooded into the treasury. Mitchell thundered about the "Parisian monstrosity," and a Cayman Islands official popped up at the United Nations to rail against "Big Brother" and the "big bully syndrome." The lobbyists neglected to mention that the Caymans were effectively governed from London. The British Commonwealth repackaged the havens' critiques in Washington and lambasted the OECD as a bullying, coercive bureaucracy.[24]

The Caribbean havens also persuaded the powerful U.S. Congressional Black Caucus to act, and to send O'Neill a letter warning that the OECD initiative "threatens to undermine the fragile economies of some of our closest neighbors and allies." The caucus made no mention of the effects these havens had on vastly bigger African nations, of course, or of the fact that the main Caribbean beneficiaries from offshore activities were rich white bankers, lawyers, and accountants.

Mitchell pounced on something else. No OECD country—not Switzerland, not Luxembourg, and certainly not the United States or Britain—was on the blacklist.

"The OECD, a rich man's club of industrialized nations, is launching this anti-tax haven jihad, but they omitted to blacklist their own members," he said. "They are a bunch of racist hypocrites. Powerful white-governed nations in Europe are targeting less powerful nations in places like the Caribbean. Somebody needs to tell the bureaucrats in Paris that the era of colonialism is over."[25]

This time, Mitchell had a point. And he soon got his breakthrough. On May 10, 2001, O'Neill wrote in the Washington Times, a conservative newspaper set up by the Reverend Sun Myung Moon that is a regular

supporter of tax havens, that the OECD's mission was "not in line with this administration's priorities."[26] The United States, O'Neill continued, "simply has no interest in stifling the competition that forces governments—like businesses—to create efficiencies." The article looked almost as if Mitchell had written it himself.

The United States, O'Neill added, "does not support efforts to dictate to any country what its own tax rates or tax systems should be."[27] It was the offshore contradiction to end them all. "Don't interfere with our rights as sovereign states!" the havens cry—while interfering merrily in other nations' sovereign laws and tax systems.

The OECD's project was dying. As Marty Sullivan of TaxAnalysts put it, the initiative "slowly dissolved into a series of toothless pronouncements, a mixture of cheerleading and scorekeeping. The OECD started to abandon its confrontational approach."[28] The OECD watered down its blacklist criteria; tax havens were now "participating partners" and escaped the blacklist merely by promising to shape up—and they need only shape up if everyone else—including the hard nuts like Switzerland or Britain or the United States or newly independent Hong Kong—did too. In other words, it would never happen.

Two months after O'Neill's letter, Senator Carl Levin, fighting a lonely rearguard action, estimated that the United States was losing $70 billion annually from offshore evasion: "a figure so huge that if even half that amount were collected it would pay for a Medicare prescription drug program without raising anyone's taxes or cutting anyone's budget." When Levin noted that fewer than six thousand of more than 1.1 million offshore accounts and businesses were properly disclosed to the IRS, O'Neill's response was simple and clear.

"I find it amusing."[29]

A July 2001 OECD deadline to avoid defensive measures came and went, and the organization later publicly said it had no intention to pursue them in the future. Mitchell's colleague Andrew Quinlan subsequently warned, for good measure, that just ten days of lobbying could shut down the OECD's U.S. funding.

The end result is neatly summarized by Jason Sharman, who wrote a well- researched book about the episode. "The OECD," he wrote, "had to give up its ambition to regulate international tax competition."[30] The tax havens had won.

A lot of the tax havens' arguments hinge on the rightful scope of state power. Democracies have long supported the principle of progressive taxation, as outlined by the Scottish economist Adam Smith: "It is not very unreasonable that the rich should contribute to the public expense, not only in proportion to their revenue, but something more than in that proportion." In the United States, as in many countries, the principle of progressive taxation has evaporated. It may not seem like that at first glance: The richest 1 percent of Americans paid just over 40 percent of all federal income taxes in 2009. The right-wing Tax Foundation claimed this "clearly debunks the conventional Beltway rhetoric that the 'rich' are not paying their fair share of taxes." Yet in 2009 the richest 1 percent owned almost half of all financial assets in the country—and the proportion was rising. This is not a story about high taxes on the wealthy but about stratospheric wealth and inequality. And the 40 percent refers only to income taxes—as exemplified by the income reporting of the four hundred richest Americans noted earlier in this chapter, rich people usually convert most of their income into capital gains, which is taxed at far lower rates than income; then there are payroll taxes and state taxes, the burden for which tends to fall on low- and middle-income people more heavily than the rich. For the four hundred richest Americans, their effective tax rate was far lower: just 17.2 percent and falling. Count offshore tax evasion by wealthy Americans, which income statistics don't see, and the picture skews further. "A quarter century of tax cuts," wrote the tax author David Cay Johnston, "has produced not trickle down—but Niagara up."[31]

During my long interview with Mitchell in Washington, we went out to a modest eatery near the Cato offices, where we bumped into Richard Rahn, a Cato staffer and a former chairman of the Cayman Islands Monetary Authority. Rahn is a gruff, serious man who wears an eye patch, and when Mitchell introduced us with great bonhomie, Rahn scowled back at him, declined to shake hands with me, muttered something about "European Commies," and stalked out. A year or so later I looked Rahn up, and this time he agreed to talk. This time he was more personable: After first hawking me around the Cato offices as a crazy European curiosity, he then handed me a little maroon passport-sized booklet containing the text of the U.S. Declaration of Independence and the U.S. Constitution. "It looks like an EU passport, doesn't it?" he rasped, twinkle-eyed. "One, of course, is an instrument of oppression. The other is a document of freedom."

"I have ancestors who fought in the American Revolution," he said, sitting me down in his own rather Spartan office. "Genetically I don't like foreign governments." After making me buy Mitchell's book for $20 (I already had a copy but didn't want to spoil Rahn's mood), we began to talk.

Rahn is not a shill for wealthy interests but someone responding, at least in part, to deep personal conviction. "You people upset me . . . I often wonder if you people are evil, or just ignorant," he declared. "Tax oppression is causing misery around the world." He said this was well established in the literature and cited some recent Bulgarian studies to back his case. "When international bureaucrats want to attack places for not imposing bad taxes," he continued, "well, I think that fits into my definition of evil." He described a "conspiracy of the international bureaucratic class" to raise taxes: not so much an organized plot but a constant effort to raise revenues to feed the bureaucrats' own well-being and privileges.

Perhaps there is a little truth in this. But his next point is worth tackling, for it is a foundation for the intellectual edifice of offshore.

"Capital is the seed corn of economic growth. Without capital, there is no growth. It is suicidal to tax your own seed corn." Along with this argument comes the tax havens' Exhibit A in their own defense: that they help smooth and promote international flows of capital, channeling it efficiently to capital-hungry developing countries, where it can grow productively and benefit everyone.

Rahn's seed corn contention contains a kernel of truth: Capital certainly can and does promote investment and economic growth. Helping it flow efficiently, at first glance, seems like a good idea. But here is where the arguments fall apart.

First, financial capital isn't the only kind of capital. Social capital—an educated and experienced workforce, a trustworthy business climate, and so on—matters more. Having seed corn is just one factor in achieving a good harvest, along with rain, good soils, fertilizer, and the human capital, knowledge, and confidence to put it all together. "Access to capital is not, in fact, the decisive constraint on economic growth," wrote the economist Martin Wolf. "It is social and human capital, as well as the overall policy regime that matter."[32] These, of course, need tax dollars.

Second, tax isn't only about revenue, the first of four "Rs" of taxation. The second "R" is redistribution, notably tackling inequality. This is what democratic societies always demand, and as the

painstakingly researched book The Spirit Level attests, it is inequality, rather than absolute levels of poverty and wealth, that determines how societies fare on almost every single indicator of well-being, from life expectancy to obesity to delinquency to depression or teenage pregnancy. The third "R"
i s representation—rulers must bargain with citizens in order to extract taxes from them—and this leads to accountability and representation. The fourth is repricing—changing prices to do things like discourage smoking. Secrecy jurisdictions directly undermine the first three, if you think about it, and possibly the fourth too.

Then there is the small matter of the evidence. One might think that capital should flow from rich countries, where it is plentiful, to low-income countries, where it is scarce, promoting productive investment, growth, and better lives for all. In the real world, this has not happened. The low-income countries that have been growing the fastest, like China, tend to be those that have been exporting capital,[33] not importing it. Countries need, above all, sound institutions, good infrastructure, and the effective rule of law—exactly what the offshore system undermines.

This is not such a surprise. A country can only absorb so much capital, just as an acre of land can only take so much seed corn. Capital loans to low-income countries haven't found their way into productive investment, but instead they have washed back into private bank accounts in Miami, London, and Switzerland, leaving public debts behind. Waves of financial capital, processed "efficiently" offshore, have led to financial crisis after crisis. In many low-income countries, as the economist Dani Rodrik puts it, "capital inflows are at best ineffective, at worst harmful."

And that is not all. Much of the world's wealth derives from what economists call rents: the kind of unearned income that flows effortlessly to oil-rich rulers. "Oil is a resource that anaesthetizes thought, blurs vision, corrupts," as the Polish writer Ryszard Kapuscinski put it. "Oil expresses perfectly the eternal human dream of wealth achieved through lucky accident, through a kiss of fortune and not by sweat, anguish, hard work. In this sense oil is a fairy tale and, like every fairy tale, it is a bit of a lie."[34]

Nearly every sane economist since Adam Smith has agreed that it is very good, and very efficient, to tax rents at very high rates. One kind of rent comes from market monopolies or oligopolies, such as those enjoyed by pharmaceutical patents and Big Pharma; by the government-sanctioned licenses afforded to the Big Four accounting

firms identified in chapter 1; by taxpayer-guaranteed international banks; or by the one-and-only Fédération Internationale de Football Association (FIFA), the super-wealthy international governing body of world football.

The global headquarters of most major players in all these highly profitable industries are located offshore, most especially in Switzerland—directly against every notion of economic efficiency. FIFA, for example, used its monopolistic position in 2010 to force poor South Africa to place it in a special "tax bubble" for the 2010 World Cup, shifting its revenues from a poor African nation to that of the company whose luxurious $200 million Zurich headquarters happens to lie just a few hundred meters from where I am writing this chapter.

Offshore is not only about tax, of course. When it comes to failures of regulation, the simplest, and commonest, argument that tax havens make is to deny responsibility and use the "just a few rotten apples" defense: The system is basically clean, but occasionally bad ones get through. Immediately after the collapse of BCCI the president of the Cayman Islands Bankers Association, Nick Duggan, said: "BCCI, is a unique worldwide situation and does not reflect on the local banking community at all."[35]

Another argument is like the one on tax: Offshore promotes "efficiency" by driving financial innovation and being what the offshore writer William Brittain-Catlin calls a "seller of novelties on the financial market, a sweetshop for capitalism, developing new flavours." The financial crisis exposed what most of this financial "innovation" really involves. Innovative forms of abuse are to be resisted, not encouraged.

The next offshore regulation argument involves deflection. Anthony Travers, chairman of the Cayman Islands Financial Services Authority, uses this technique widely. In a 2004 article in The Lawyer entitled "Framing Cayman,"[36] he sought to explain why some of the biggest economic scandals in world history—BCCI, Enron, and Parmalat, in each of which Cayman played a pivotal role—were in fact not the Caymans' fault at all.

Parmalat was brought down by its Cayman-based finance subsidiary Bonlat Financing, which had fraudulently claimed to hold nearly 4 billion euros in assets. According to Travers, the missing Bonlat billions "never existed at all, save in a document forged in Italy by a corrupt Parmalat

executive. If that is the nature of the fraud in relation to Bonlat, how precisely is the ‘part’ of

the Caymans 'substantial'?" In other words, though the Caymans was central to the fraud, it is blameless because the fraudsters were actually elsewhere. He said a similar thing about BCCI. "Had BCCI not been so licenced [as a deposit-taker] by the Bank of England, at a time when the Caymans banking regulator was on secondment from the Bank of England," Travers wrote, "its subsidiary would not have been licenced in the Caymans." As for Enron's 692 opaque Caymans subsidiaries: "These were on balance sheet consolidated subsidiaries which owned the overseas Enron operating assets, thereby lawfully deferring US taxation," their profits "properly accounted for and audited." Enron's Caymans limited partnership LJM No. 2, Travers continued, was "a victim and not a perpetrator"—the perpetrators were Delaware limited partnerships. In other words, the frauds were carried out elsewhere. And he added, "None of the financial recklessness that has brought about much of the current global crisis occurred in or involved the Cayman Islands."[37]

The breathtaking chutzpah of Travers's claims is leavened by the fact that his arguments contain a truth: The frauds could not have happened only in the Cayman Islands. They required culprits elsewhere too. "The charlatans responsible for this type of behaviour," Travers notes, "are far closer to Westminster than the Caymans."

Quite so. But he is deliberately missing the point: This is how the offshore system works. Offshore structures always serve citizens and institutions elsewhere—so the beneficiaries are always elsewhere. This is why it is called "offshore." Plausible deniability is the whole game. The fraudsters may well be elsewhere, but offshore is what makes the fraud work. Secrecy jurisdictions are to fraudsters what fences are to thieves. These arguments from the Caymans are like those of one who is caught fencing stolen property blaming the police for not stopping the thieves who stole the property in the first place.

The Caymans is a place "which has pledged to meet the highest and quite new international standards of tax transparency," Travers continued, then added a more menacing note. "If it were not for a quirk in the laws of defamation," he said (noting that jurisdictions cannot sue for libel), "comment of this sort would be actionable."

On September 11, 2001, two months after the OECD's tax haven project died, with Al-Qaeda's attack on the United States, a new tale of

hypocrisy and deception began that continues up to today.

After the attacks the George W. Bush administration suddenly wanted better cooperation and transparency from the secrecy jurisdictions on terrorist financing, though it wanted to leave offshore tax evasion alone. The problem was how to do this, given that the two practices involve exactly the same jurisdictions, structures, and techniques.

The answer came in the form of one of the slyest offshore tricks ever devised.

The best way for countries to share information with each other is through so-called "automatic" exchange of information— where they tell each other about their taxpayers' financial affairs as a matter of course. This happens routinely inside Europe and between a few other countries, and although the system is leaky—it needs shoring up to cover all sorts of loopholes—it works well enough. Privacy is not invaded: Tax authorities keep the information to themselves, just as doctors keep details of their patients' hemorrhoids and venereal diseases confidential. Doctors and tax authorities need the information and can share it with others who need it, but they don't publicize it.

But there is another way of sharing information, known as "on request": A country will agree to hand over information about another country's taxpayers—but only on a case-by-case basis, only when specifically asked, and only under very narrow conditions: You must be able to demonstrate exactly why you need the information. In other words, when you request the information you must already know, more or less, what it is. No "fishing expeditions," or general trawls to find tax cheats, are allowed.

You can't prove criminality until you get the information, and you can't get the information until you can show the criminality. Catch–22's Captain Yossarian would have appreciated the double bind. "On request" information exchange is a fig leaf. It lets tax havens claim they are transparent while continuing business as usual.

The "on request" model, of course, is the one that got the Bush administration's endorsement. Instead of transparency, we got a very conditional transparency: only when there is permission to be transparent. The "on request" standard has become the OECD's model too.

It is hard to know how much information is exchanged "on request" globally, but Geoff Cook, chief executive of Jersey Finance, confessed in March 2009 that in the seven years since Jersey signed a tax agreement with the United States, it exchanged information with American investigators on just "five or six" cases.[38] Compare that to the

million-plus U.S. offshore accounts and businesses Senator Levin identified, and clearly the system is a joke. Requests for information can take months or years to process—and the assets under investigation can be shifted elsewhere in hours or even minutes.

It gets worse. After the financial crisis struck in 2007, the OECD, by now at the mercy of the secrecy jurisdictions, set up another piece of sleight of hand to respond to public pressure. At the urging of G20 leaders the OECD set up a blacklist for tax havens, and the way to get off the blacklist was to sign 12 agreements to share information with other countries, using the OECD's hopeless "on request" standard.

The OECD began to claim that a major crackdown was under way. "What we are witnessing is nothing short of a revolution," boomed the OECD secretary-general, Angel Gurría. "By addressing the challenges posed by the dark side of the tax world, the campaign for global tax transparency is in full flow." Newspaper articles ran headlines like "Bank Secrecy Is Dead," and British prime minister Gordon Brown declared the aim of the blacklist was to "outlaw tax havens."

As the new OECD push got under way, tax havens rushed to negotiate new agreements in order to sign the requisite 12 that would get them off the blacklist. At the latest count a third or so were with Nordic states, especially with such global economic giants as Greenland, San Marino, and the Faroe Islands—and another third or so were with other tax havens. The havens did sign a few with larger economies, though as usual, nobody bothered about the developing countries, which suffer most from offshore abuse. India, China, Brazil, and most of Africa were entirely absent from the list. Five days after the G20 had declared that the era of banking secrecy was over, the OECD's blacklist was empty.[39]

"The blacklist has been a sad joke," said Professor Michael McIntyre of Wayne State University Law School, who knows this area better than almost anyone. "The OECD program has provided a patina of respectability to countries that are actively assisting taxpayers in evading taxes in their home country."[40]

The blacklist, in short, was a whitewash.

After a temporary setback during the financial crisis, the offshore system is now growing again at ferocious speed. And the OECD insists to this day that its next-to-useless "on request" form of information exchange is "the accepted international

stand
ard."

As with tax, so it goes on regulation. International authorities have long recognized the problem that the global patchwork of fragmented financial regulation offers seamlessly integrated global banks vast opportunities to play the game of arbitrage between different jurisdictions, especially offshore. So world leaders are pretending that something is being done to constrain bankers' impulses. The Bank for International Settlements, in Switzerland, is the biggest of these, along with the Financial Stability Forum that it hosts, set up in 1999 to deal with financial risks and crises. Between them, they have presided over the biggest global financial crisis since the Great Depression.

"Whenever the cops come calling the banks have a ready response for the particular regulator in each country," explained Jack Blum. "No one sees the whole picture and it's really no one's job to even try. When the big and scary stuff happens, the bankers and their friends trot out the Bank for International Settlements and the Financial Stability Forum as proof of effective coordination and regulation. But these things are glorified fig leaves. They have produced absolutely nothing of real value beyond a few minor process quick fixes."

Rich governments cannot be trusted to do the right thing on tax havens and transparency. Many will demand more transparency and more international cooperation, even as they work to frustrate both. They will call for reasoned debate as they engage in character assassination, secret deals, and worse. They will talk the language of democracy and freedom, the better to defend unaccountable, irresponsible power and privilege.

Civil society is, thankfully, beginning to stir. The current thought leaders are Global Financial Integrity in the United States and the Tax Justice Network (TJN) in Europe, whose expertise has been invaluable for this book. John Christensen, TJN's director, remembers holding an expert briefing on offshore for staff in the Senate buildings, in Washington D.C., and seeing a senior congressional staffer with tears in her eyes as she described her happiness at seeing civil society at last begin to engage, after spending so long battling to get any traction on offshore issues, in the face of the ferocious Washington right-wing counter-lobbies. "She said she had waited for years for civil society to take an

interest in this." A much greater mobilization is now required.

How do all these shaky doctrines—the OECD's information exchange standards, the contradictory double act of tax-cutting increasing tax revenues, and tax-cutting acting to Starve the Beast, and Mitchell's offshore incoherences—continue to thrive? The author Jonathan Chait provides a good answer.

"The lesson for cranks everywhere," he wrote, "is that your theory stands a stronger chance of success if it directly benefits a rich and powerful bloc—and there's no bloc richer and more powerful than the rich and powerful." But the last word here goes to Bob Mcintyre of Citizens for Tax Justice, who has spent much of his life battling with the armies of lobbyists in Washington. "There are so few of us," he sighs wearily, "and so many of them."

THE LIFE OFFSHORE
The Human Side of Secrecy Jurisdictions

IN 2009 I MET UP WITH A FORMER PRIVATE BANKER, Beth Krall, in attempt to understand a question that had been nagging me: How do private bankers who shelter the wealth of gangsters and corrupt politicians justify what they do?

We met in the bustling café at Kramer Books, off Dupont Circle, in Washington, D.C., where she was living, one Sunday in 2009. She had left private banking and had joined the nongovernmental sector. Dressed in a striking black and white coat, she still looked very much the stylish international financier.

Aged 47, and with nearly 24 years in the banking business, Krall (which is not her real name) was still coming to terms with her past life. She hated what she had seen and was clearly unsettled by exposing the horrors she had experienced, but she adamantly refused to reveal any of the client details she had sworn to protect. She was wary of disrupting the many friendships she had made in the industry and was careful about what she would and would not say.

Krall's last offshore posting was in the Bahamas, the island archipelago with over three hundred thousand residents that has been an important offshore center since the golden age of American organized crime in the early decades of the last century. A few months earlier, a practitioner in the Caymans had warned me to watch for my personal safety if I go "asking all these questions" in the Bahamas. Krall said she was unsure what might happen to her if she went back, as she was partly breaking the private bankers' code of silence. "I don't want to have concrete shoes put on me," she said, without smiling. One reason for her fear was something that had angered her in the first place: that so many of the people she dealt with were powerful members of society in their countries. One case involved "very prominent people in world politics."

Unusually, for a foreign banker in the Bahamas, Krall became closely involved in local Junkanoo cultural celebrations, a mixture of Latin

American and Caribbean carnival traditions that a dedicated website calls "the greatest cultural event of not only The Bahamas, but also the world at large." She seemed distressed, while we talked, at the thought that fellow members of her Junkanoo group—not to mention many other friends she had left behind in Nassau—might judge her criticism of the country's offshore industry "anti-Bahamian." When we spoke she was still working up the courage to tell them why she could not go back. She was still redefining her relationship with the offshore values within which she had made her career: that secrecy is good, whatever brings in the money is good, and if you break the code of silence you are sloppy or treacherous.

People want to do the right thing, and it is easy, offshore, to be seduced into the idea that what matters is doing the right thing by your peers—and the rest of the world can take care of itself. In the rush to make a career, one can only make progress by ignoring the structural implications of what one does. She is one of very few to recognize the full moral weight of what she was doing and to step away.

Krall was born in Leicester, England, and took her banking exams straight after school, starting in Britain's Midland International bank in 1980 before moving to a partly state-owned Swedish bank and then, in 1987, to Chase Manhattan in Luxembourg to work in its "back office"—the administrative side, where Chase was a paying agent for certain Eurobond issues. She moved to a Brazilian bank, Banco Mercantil de São Paulo, then to Cititrust in the Bahamas, where she ran evaluations and accounting for their mutual funds business. From this point onward, Krall declines to identify her employers precisely.

She became a client relationship manager with the private banking arm of a well-known British bank in the Bahamas. They worked with what were euphemistically called "managed banks" or shell banks, an offshore specialty. These have no real presence where they are incorporated, so they can escape supervision by responsible regulators. A shell bank will typically be operated through an agent in the tax haven jurisdiction, perhaps a famous global bank, which provides a reassuringly solid name and address to back the shell but will otherwise carry no responsibility or even real knowledge of what the shell is actually up to. So a shell bank might be incorporated in the Bahamas, for example, but its owners and managers could be anywhere.

Shell banks handle business that many banks will not touch. U.S. senator Carl Levin notes that they are generally not examined by regulators, and virtually no one but the shell bank owner really knows

where the bank is, how it operates, or who its customers are. The bank Krall worked for provided a well-known name to reassure the Bahamas regulator. I asked Krall how much due diligence her British bank did on these entities. “Ha ha. Yeah,” was her initial reply. “These banks would send quarterly statements to the Bahamas Central Bank—but it wasn’t our job to monitor them.”

There would literally be brass plates in her British bank’s reception area saying “Banco de X”—perhaps an Argentinian bank using the Bahamian address and phone number of the British bank on their headed notepaper. The Bahamas regulator could not find out what was going on back in Argentina, and vice versa: the classic offshore “elsewhere” technique. Predictably, some of these banks failed, despite being audited and passed by Big Five accounting firms,[1] and Krall remembers taking calls from angry depositors. “People were on the phone in tears, with their life savings gone, and I was saying to them, ‘There is no point coming on a plane to look for the money because there is no money here.’” The money never was there.

With the terrorist attacks of September 11, 2001, prompting the United States to legislate against shell banks, a bank in the Bahamas now had to employ two senior bankers and keep its books and records there to be judged real enough to do business. “That means a bank maybe with a room or suite in a building, with two people in it—that’s a bank now,” Krall said. She pointed me to the current website of a Bahamas-based trust company that will provide you with exactly that: the appearance of being a real bank, including two staff members as directors of your bank and a place to keep the books and records. Such a set-up can allow business almost as usual, yet still check off the regulators’ boxes.

Krall moved to a big European bank, again as a client relationship manager—in effect, someone who finds wealthy clients and keeps them happy. Trawling for business, she was routinely pointed toward Latin America, where she traveled frequently.

“On the immigration form you would write that you are going for pleasure—though your suitcase would be full of business suits and portfolio evaluations, or marketing materials and presentations explaining the advantages of a trust in the Bahamas.” The client’s name would be absent from the portfolio evaluations: In fact, the bank would not even record it as the account

name. “You’d cut off the account name and number so it was just a list of securities and holdings: you could never attach it to anyone.” It was nerve-wracking, sometimes, going through airports, but she always got through unchallenged.

Apart from the anxiety about getting caught, Krall said there was rarely, if ever, a feeling you were doing anything wrong, despite often helping clients break the law. Part of what she called “managing not to check into your conscience” was that there were always cases where you could believe you were helping someone. For example, countries like Brazil have “forced heirship” dictating who in a family gets the assets after the parents die—and an offshore trust may be a way to get around this. Krall cited a case she knew of in another country where forced heirship would have granted the assets to a playboy son instead of to the family’s preferred beneficiary, a daughter with special needs. As I explained in the last chapter, human stories like this are commonly used to justify oceans of wrongdoing in the offshore world.

Krall would cold-call top lawyers and asset managers, hoping to get into what is known in the trade as the “Beauty Parade,” the lineup of obliging banks that clients and their representatives will look for to manage their riches. The key is to build a relationship of trust, mixing the good and the bad. With the good trust you offer a solid, safe return on the assets; the bad trust is a confidence that you will keep their identities secret and will break laws on their behalf. In pursuit of these elusive relationships, Krall went to polo games, the opera, orchestral concerts in Rio de Janeiro, and umpteen working breakfasts, lunches, and dinners in the most expensive restaurants in town.

Despite her growing qualms, Krall ended up working for a Swiss private bank in the Bahamas. This was no ordinary bank: It had only a hundred or so clients. It was also the only bank where she actually saw a suitcase full of cash. “My bank never once had a client walk through the door,” she said. “The bankers and their clients go on big game hunting trips, or to the ballet in Budapest. That is where it happens.” From her tone, she made the “it” sound like some sordid sexual act.

Her bank was run out of Switzerland, and the Bahamas was purely a “parking space” or transit point for money: an extra layer of secrecy. A major driver was, of course, the imperative to receive and store the proceeds of crime. “I felt I was prostituting my personality, just to get money in the bank,” she said. “I came to realize that the system I was involved in contributes to the perpetuation of poverty in the world.” She thought a bit, then added, “But I did enjoy the adrenaline. When it fuels

you, you don't question what you otherwise would."

Her colleagues hailed from old European aristocratic circles. While Krall was perfectly good at her job and had close working relationships with top lawyers, asset managers, and so on, a gap remained. "They went to parties with royalty, with ambassadors," she said. "I wasn't in their circle."

At the time, laws in the Bahamas were being tightened a bit, following a feeble global crackdown, and she moved sideways in the bank to work as a "compliance officer." These days, offshore bankers make a big show of their "Know Your Customer" rules, to keep out the bad money. Depositors may have to supply a certified copy of a passport, for example, and divulge where their money came from. Jurisdictions like the Bahamas and the Cayman Islands put these requirements into their statutes, and banks must comply; they employ compliance officers like Krall to enforce this.

That, at least, is the theory.

In her new job Krall began to learn of the many devious avenues around the rules. "You would ask for the source of funds— and they could tell you anything," she replied. "You didn't ask for documentation." Another compliance officer Krall knew was expressly forbidden from seeing certain files. A loophole in Bahamas law let institutions waive due diligence checks on clients if they were referred from a financial institution in a jurisdiction where the legislation is supposed to be good. Once in a while a bank would uncover a money-laundering case to show it is enforcing the law: They were happy to do this, Krall said, provided it did not expose anyone the bank would not want to upset. Legal frameworks that distinguish between the criminal and the legitimate have eroded away offshore, replaced by networks of trust that distinguish between the well established and respectable, on the one hand, and the unknown and dispensable, on the other.

Individuals with sums to launder or invest with minimal taxation want to know that they are dealing with people who can be trusted not to have moral qualms. If the bankers don't know you, you will have to jump through many hoops; if you are a long- standing and trusted client, the rules fall away. These trust-based networks, deferential to the aristocracy of wealth and privilege and resistant to formal laws, are the ultimate source of comfort for the banks' wealthy clients. The similarities with un-spoken Mafia codes of behavior are no coincidence at all.

"These banks are competing with each other, but they also scratch each others' backs," Krall said. "The heads of these banks are part of a

circle of friends and business associates, where the whole social circle revolves around it: a social structure intertwined with a business relationship. They will pass business between each other."

"The law says you must report suspicious activity to the Financial Intelligence Unit [FIU] or the police," she continued. "But in a very small place, everyone knows everyone and their cousin. I couldn't trust a report being handled confidentially or through proper channels. There is a huge chance that someone in the FIU or the police will be close to people in the bank where you work . . . and this could cause me harm for raising the issue."

Krall was supposed to check for suspicious movements through the accounts—of which there were plenty. She raised many red flags. Her managers "would say, 'This was a commission' [on a contract]." Were these bribes? Commissions on what?

"I went back, and never got an answer."

One Swiss-based trust company that had a relationship with her bank displayed almost no information on their website, bar some photos of a nice fountain in Geneva. "The crap they brought to us was unbelievable—there is no way a responsible trustee should take this on. You would have no idea who the trust settlors were; what the assets were or where they came from. I objected strongly—but the bank took them on."

Over time her qualms grew, and she began to find herself in a very lonely place. "I couldn't even tell my boyfriend. I was supposed to abide by bank secrecy," she remembered. "It wasn't easy for him, with someone walking through the door at the end of the day, pale, drained, and sick, with stuff going on he can never know about." Other compliance officers whom she chatted with also felt their powerlessness. "There was a fear abroad," she remembered. "You have this dilemma: the difficult news you will give to directors may not be appreciated. Most people want to do their job, protecting the bank and country from the taint, as well as doing their ethical, moral, and legal duty. You go into the job with that mind-set."

I chatted to Krall about my own recent experiences in the Cayman Islands: about what happened when I revealed to one of my first interviewees in the Caymans that I had links to an organization that had been critical of tax havens. That meeting ended in minutes. I had been referred to this interviewee by a mutual friend, and after our meeting my friend got emails stressing how "uncomfortable" she felt, and requesting promises on promises that I would never identify her.

People I met in the Caymans almost always seemed to find it distasteful, or changed the subject, when I asked questions

such as whether or not one might balance the prosperity of the fifty thousand–odd islanders against the interests of 350 million North Americans, 600 million Latin Americans, and the same number again in Africa. Even more surprising to me was that despite the confidence with which I hold my own views, I found myself feeling shy, almost ashamed, expressing them on the Cayman Islands, from the first day.

Krall recognized this shifty feeling immediately. “When I was planning to leave the Bahamas friends were kindly introducing me to other private banking opportunities,” she said. “The thought of continuing in that profession made me feel disgusted to the point of being physically nauseous, yet here were my dear friends, working in exactly the same industry, being helpful. How could I say to them directly there was no way I could do that work anymore, while they were still in it?”

“I felt that ‘unclean’ feeling from every direction: unclean for having done that kind of work and yet unclean with feeling as though I was being, somehow, not truly and openly honest with my friends.”

Stephanie Padilla-Kaltenborn, an American mother of two and an old friend of mine who lived until recently in the Cayman Islands, recalled soon becoming aware of unspoken limits of curiosity and candor in the secrecy jurisdiction. “It’s a feeling when you live there that there’s something under the surface and I did not want to look,” she said. “I knew the answers would be more complicated than I could deal with. You cannot talk to people—it’s a strange invisible line you can’t cross. It’s a semi-chosen state of mind—a self-censorship.”

Krall’s experiences, and her treatment, are echoed in the widely publicized case of Bradley Birkenfeld, the gregarious old Bostonian UBS director who recently helped the U.S. Internal Revenue Service dismantle a $20 billion UBS program to help wealthy U.S. residents evade taxes and forced Switzerland to accept a new, somewhat more transparent tax treaty with the United States. Birkenfeld described in court how UBS bankers would frequent events like the UBS Trophy yacht race off Rhode Island, the Art Basel contemporary art fair, classic car shows and concerts, and—his personal favorite—a ten-thousand-dollar-a-head evening with Elton John at the Waldorf Astoria in 2005, illegally soliciting client business. “I’d say, ‘Do you want to go to Wimbledon, have lunch and see the match?” Birkenfeld recalled.[2] “‘Do you want to come

to Oktoberfest and drink some beer and look at hot girls? Whatever you want to do.' I would go to the Cannes Film Festival, the Venice Film Festival, the Bangkok Film Festival." On one occasion, he smuggled diamonds into the United States in a toothpaste tube. His star client, Oleg Olenicoff, explained how impressive the Swiss bankers' performance was while courting his tax-evading business. "It's all very proper and precise," Olenicoff recalled. "You feel you're in the German Reichstag with all the generals there!"[3]

While visiting the Caymans in 2009, I was chatting with a former senior Caymanian politician at his house when a thickset, dark-skinned Caymanian, probably in his forties, wearing a blue polo shirt, khaki shorts, and sunglasses, walked in and introduced himself as "The Devil."

I still do not know his name, though my sober and well-connected host vouched firmly for him. The mystery stranger said he had serious credentials in international law enforcement so—this was all I could think of—I tested him by showing a photo on my phone that I'd recently taken of Robert Morgenthau, the Manhattan district attorney, a legend in the business. Not a sophisticated test, for sure, but my stranger passed it without hesitation.

He said he had spent years probing some of the global sins that freewheel through the Cayman Islands and chatted about several cases, many of which I'd never heard of. One concerned Imad Mugniyah, whom I later discovered to be a senior Hezbollah official killed in Syria in 2008; another was about a Cayman company fingered in the transfer of missile technology to Iran (later I checked with the U.S. Office of Foreign Assets Control and discovered this was still a very live investigation). He touched on some Cayman operations of the international arms dealer Victor Bout that never reached the media. He spoke of Cayman hedge funds, mutual funds, and special purpose vehicles, and he described these sectors as being riddled with crime, though he declined to go into any real details. At this point, he supplied me with a health warning.

"If we discuss this with you, you will end up like Salman Rushdie. There are things here not to be discussed. I mean it," he said. "This is a wicked, vicious place."

He said he had become too interested in certain stones that would normally, and deliberately, have been left unturned—and this had made

him an enemy of the establishment. This, he said, was why he called himself "The Devil"—for that was how they treated him now.

"You have to have a deep soul," he continued. "They carry out economic isolation—they destroy your credibility and your integrity. They will strip you of your dignity. We operate here under a code of silence—omertà. They will tell you this is not so."

"There is a cabal here…. These people in [the] firms get together—it is an informal thing—and say this guy is causing trouble. You will get hints: Be careful! from your boss. I got this." Powerful Masonic and other networks are at play; the cabal does not include Caymanian politicians, he said, but added, "They will give the politicians a call and tell them what to do." My host—the only dissident I encountered on the island—interjected, adding that this cabal was "spoken of in terms you'd speak of a ghost."

"The very difficult part of this," The Devil continued, "is that a few people here—those people who have committed what the international community would consider unlawful acts—they get the CBEs, the OBEs [British royal decorations] . . . they sit on boards, they have high status, and they are looked on as statesmen."

He described another avenue around the legislation. Cayman boasts of its intrusive Know-Your-Customer laws, which are fairly strong—on paper. Yet it was just as Krall had found it in the Bahamas: The rules fall away if you are a trusted part of the network. "If I do not have a relationship [with an institution] they will want to know even my underwear size," The Devil said. "But if you have an established relationship with a bank over time, the rules don't apply to you. If you are established as a well-to-do person, your credibility isn't questioned." His words remind me of an internal memo at the Riggs Bank brought to light in 2004 by the U.S. Permanent Committee on Investigation. "Client is a private investment company domiciled in the Bahamas," it said, "used as a vehicle to manage the investment needs of beneficial owner, now a retired professional who achieved much success in his career and accumulated wealth during his lifetime for retirement in an orderly way." The "retired professional" was the Chilean torturer-in-chief and former dictator Augusto Pinochet.

Beneath the Caymans' standard official line that it is a "transparent, well- regulated and co-operative jurisdiction" lies a more fiendish reality.

Later I recounted my "Devil" story and Krall's tale to an accountant who had worked in the Caymans, who nodded fiercely

when I mentioned the reference to Salman Rushdie. “Yes, yes, it’s serious,” he said. “It’s not naive to take these threats seriously. You will be the first to go to prison if something goes wrong.” He told me about several mysterious offshore deaths, including that of a Swiss banker, Frederick Bise, who was found dead in 2008 in the hatchback of a burning car in Grand Bay, on the Caymans, with blunt force injuries to his head.

My interlocutor, a former hedge fund administrator, compliance officer, and chief accountant, described how he slowly grew to see what was going on.

“I started feeling bad three or four years after I arrived,” he said. “We ran business through the accounts, which was kind of dubious: you’d get information here and there and put it together—but you could not ask questions. Even if you had indications, you could not speak up. I did speak up, and the result was that I got less information at meetings. Information was sort of prediscussed: I felt that a kind of show was going on.”

He came under suspicion and was overloaded with work: twelve hundred hours of overtime in a year, with no compensation. “The CEO said, ‘This is part of your job.’”

“We replaced 40 to 50 percent of our staff within two years: people who do not fit into the system for any reason are pushed out. Ask questions, and you can get fired, or given so much work [that] you [eventually] resign. It is not done obviously: they won’t call you into meetings and say, ‘Stop asking questions.’ These are highly intellectual, well-educated people: they have their own way of communicating. You learn to read between the lines. They will not say, ‘I am threatening you.’ They will say, ‘This person does not fit into the picture.’ I have been in the business for years, and I know what they mean.”

Most people working offshore only see fragments of the big picture, so cannot understand what is going on. “For example, if there is a trust set up in the Caymans, and the securities portfolio is in Switzerland, you will get very little information in the Caymans: you won’t know the reason why things happen. The ones who commit the crimes—those people who set up the trust or the Special Purpose Vehicle—will often sit in New York or London. The employees in many cases are honest people, trying to do their best: it will be the lawyer, or the CEO, or the chief operating officer, who knows the truth.” Once you become part of senior management, then “you are part of the inner circle and things become much clearer. You are part of the plot. You know what the real

products and services are, and why they are so expensive."

An old offshore saying encapsulates it: "Those who know don't talk, and those who talk don't know."

Other subtle checks on troublemakers abound. To stay in the Caymans, for example, you need a work permit. Any expatriate who causes trouble—whether a seconded police official, lawyer, regulator, or auditor—can have his or her work permit revoked by the "Cayman Protection Board," which grants permits. Foreigners in the Caymans are made painfully aware of their vulnerability on this.

"If you blow the whistle and stay on the island—and this is general in offshore centers—you don't have whistle-blower protections at all. If you speak up in one place, the network works in a way that you will never get work again. It is suicide, physically and economically. There is no way you would find protection." My interlocutor chopped the palm of one hand with the other for emphasis.

"Have you seen the John Grisham film The Firm? It's worse. It's not only the lawyers—it's the whole political environment."

Before visiting the Caymans in 2009, I had contacted island authorities to request interviews and told them I had done work for the Tax Justice Network (TJN), the expert-led organization that criticizes secrecy jurisdictions like Cayman. On arrival, the government spokesman Ted Bravakis said because of this there was "no willingness to engage." A decision to shun me, he said, had been taken "at the highest levels of government."

Earlier, I had emailed a top official in the Cayman Islands regulatory apparatus, requesting an interview. He copied me into an email to local practitioners, criticizing efforts by his predecessor, Tim Ridley, to help me get interviews during my trip. "I do wish Tim would stop hawking this chap around as if to say he is doing us a favor," the official wrote. "We are going to prepare a factual anodyne piece in writing but will decline any on the record interview." I told him he may not have meant to copy me in on the mail. "Quite so," he replied, then put his finger squarely on an important truth about such places. "I have no problem with you understanding how the world at large regards the comments of TJN," he said. "I say so directly at every opportunity and meet with uniform agreement."

In the official's "world at large"—the offshore environment—there is no

opposition to the establishment consensus, it seems. There is, in fact, something generic about island life that encourages the group-think that the official describes. In his novel Snow Falling on Cedars, the writer David Guterson captures an essence of it. “An enemy on an island is an enemy forever. There is no blending into an anonymous background, no neighboring society to shift toward. Islanders were required, by the very nature of their landscape, to watch their step moment by moment.” The social and political inhibitions islanders feel, he continued, “are excellent and poor at the same time—excellent because it means most people take care, poor because it means an inbreeding of the spirit, too much held in, regret and silent brooding, a world whose inhabitants walk in trepidation, in fear of opening up.”

In the island goldfish bowl, you cannot hide. This ease of sustaining an establishment consensus and suppressing troublemakers makes islands especially hospitable to offshore finance, reassuring international finance that they can be trusted not to allow democratic politics to interfere in the business of making money. In the British tax haven of Jersey, three local sayings encapsulate the constant social pressure: “Don’t hang your dirty linen out in public,” “Don’t rock the boat,” and “If you don’t like it, there’s always a boat in the morning.”

This groupthink does not originate with the island havens, which are just fortified nodes in bigger global power networks led by Britain and other large powers. But they have, with their intolerant environments, come to host and protect cultural concentrations of antigovernment, kick-the-poor attitudes that originate elsewhere. In the absence of reliable dissent, these attitudes have flourished, unchecked.

John Christensen, Jersey’s former economic adviser who turned dissident, describes encountering extremist right-wing offshore attitudes when he returned to his native island in 1986 after working overseas as a development economist.

In this year of the City of London’s “Big Bang” of financial deregulation, he found a tax haven amid a spectacular boom. Old town houses, tourist gift shops, and merchant stores in Jersey’s beautiful capital St. Helier were being knocked down and replaced by banks, office blocks, car parks, and wine bars. An employment agency told him he could have any job he wanted; he had three offers the next day. He began employment with an accounting company, working with over 150 private clients.

The firm practiced reinvoicing: the practice I described earlier, where

trading partners agree on a price for a trade but record

it officially at a different price to shift money secretly across borders. Global Financial Integrity, in Washington, D.C., estimates that about $100 billion is drained from developing countries each year just from reinvoicing—about as much as all foreign aid from the rich world to the poor. It is just one part of a much larger picture of outflows of capital. “This was about capital flight . . . shifting capital out, and evading tax: the really nasty stuff,” Christensen said. “I saw this stuff coming in daily.” The accountancy firm provided a fax number, headed notepaper, a bank account, and a veneer of exceedingly British solidity and respectability.

Christensen worked there for 20 months, mostly handling clients based in South Africa (where much of the work involved evading antiapartheid sanctions), Nigeria, Kenya, Uganda, and Iran. Working undercover, he systematically combed through hundreds of client files and gradually put pieces together. He learned that a very senior right-wing French politician was using his political influence to secure planning permission on behalf of developers with whom he was involved, in a series of property deals. The Jersey link meant nobody in France could find out what he was up to. “You don’t get that information from a cursory look at the file,” he said. “I got hold of this guy’s name by talking to an office in France: they told me ‘I’ll have to speak to the Senator about that.’ If you work there long enough, they get to know you, and get comfortable telling you things. The market rigging, the insider trading: I was sitting there thinking, ‘Holy shit—this is dynamite.’ These were very prominent families; this would be on the front pages if it got out.”

But even today Christensen, like Krall, won’t tell tales about the particular secrets he encountered, having signed oaths and contracts for life. “If I transgressed those I could be thrown into a pit forever.”

Reinvoicing is just one more workaday business sector in the world of offshore finance, and his firm and colleagues saw it as good business practice. “They rationalized it in all sorts of ways: foreigners were protecting their money from political risk or unstable currencies. People in Africa are poor because they don’t work hard enough or they are corrupt; countries are poor so we send them aid money. That kind of thing. They didn’t want to think about economic systems.”

He moved through various jobs, and each time he expressed unease about the origins of some of the money, much of it from Africa, he was brushed aside. One Friday, ahead of the habitual office binge-drinking session, his section supervisor told him she didn’t want to discuss these things and didn’t “give a shit about Africa anyway.” Her attitude,

Christensen said, was typical. “Profitability was sky-high, and nobody made the connection between their actions and criminality and injustice elsewhere. None of the financial intermediaries involved—banks, law firms, accountants, and auditors—bothered to report or even question illicit transfers.”

He met an old childhood acquaintance, now a chartered accountant, drunk in a pub, and told him all about his recent experiences in India and Malaysia. “No interest. He was in a bubble: last night’s party, which car I was driving, who’s screwing whom—that was it. I can’t tell you how much of a shock it was to come back. There were really extreme views I was picking up on in Jersey: deep racism; sexism; the repressive feel; the awful in-your-face and aggressive consumerism I’d never seen before—and an almost fanatical hatred of any progressive ideas.”

Progressive legislation takes years to seep to Jersey from outside. Britain abolished its antisodomy laws in 1967, but Jersey only repealed its law, under subtle pressure from an embarrassed Britain, in 1990. “There was this ‘don’t speak out’ mentality,” Christensen said. “In London, all my mates had taken antiracism, and stuff like that, as normal. Back in Jersey, I got, ‘You don’t do that here, sonny.’”

He turned up at a cocktail party on a motorcycle and was assailed by a guest, a senior Jersey business figure, who said his crash helmet was an infringement on his liberty. “He was anti-seatbelts, anti-tax, and anti-government. He would say apartheid was good for black South Africans; that we should reestablish colonialism; that ‘these people’ had been much better off under white governments.” Christensen clashed with Sir Julian Hodge, a pillar of the Jersey banking establishment: “a mega- apologist for apartheid; a mega-pusher for empire; a libertarian beyond anything I’ve met.” He remembers a stand-up row at a public meeting with the Reverend Peter Manton, a Jersey senator and Anglican minister who had also said publicly that “the blacks” in South Africa were better off under apartheid than anywhere else (Manton was subsequently prosecuted for sex offenses and later died).

Offshore can feel like an adolescent fantasy of the world, where white men sort things out over Scotch whisky and see the rest of the world as a consumable resource. At a government committee meeting exploring sexual discrimination and equal opportunities for women, Christensen remembers a senior politician made a show of falling asleep and snoring. Another politician, who ran his own business, went further. “He said, ‘If any of my girls got pregnant I would sack them immediately: nobody wants to see a pregnant girl behind the desk.’ That is how he

referred to all women—girls."

"The ruling classes realize they don't need to worry about the Democrats coming to power in the U.S., or Social Democrats coming to power in Germany, or Labour coming to power in Britain," Christensen continued. "They realized they didn't need to fight the fight at home: they already had this flotsam and jetsam of the empire strewn across the globe, with their red post boxes and British ways of life, and incredible subservience to the English ruling class. In Jersey I was amazed by how fawning the local politicians were to outsiders with money. There was this idea, 'We can take over our own little places, and the locals will be grateful to us. The checks and balances aren't there; the press isn't there; and they resent interference from outsiders.' Happy Days: Wall Street and the City gentlemen had found a way around the threat of democracy."

Offshore attitudes are characterized by amazing similarities of argument, of approach, and of method, and some striking psychological affinities, in a geographically diverse but like-minded global cultural community of offshore. A peculiar mixture of characters populates this world: castle-owning members of old continental European aristocracies, fanatical supporters of the American libertarian writer Ayn Rand, members of the world's intelligence services, global criminal networks, assorted lords and ladies, and bankers galore. The bugbears for this zone are government, laws, and taxes, and its slogan is "freedom"—at least for wealthy elites.

And these attitudes fit seamlessly with another characteristic of small jurisdictions: collective inferiority complexes where residents see themselves as plucky defenders of local interests against the predations of big, bullying neighbors. From this worldview of mistrustful self-regard, it is but a short step to a libertarian, leave-us-alone worldview that sees any self- advancement at the expense of outsiders as valiant resistance against tyranny. This worldview, of course, dovetails closely with offshore's ethical framework, which holds the rights of citizens and governments elsewhere to be inconsequential, which sees democracy as a "tyranny of the masses," and holds the very idea of society with disregard, even contempt. Providing facilities for foreign tax evasion clearly fits this framework, as does a general hatred of tax.

This concentration of extremist attitudes in Jersey was self-reinforcing,

as Christensen explains. “Most liberal people like myself left,” he said. My socially liberal friends from school, almost all of them left Jersey to go to university, and almost all of

them didn't go back. I can't tell you how dark it felt. I have never been a depressed person but I went into a big one there.
Everything I valued seemed of no significance.
There was no one I felt I could turn to."

He almost left but was persuaded to stay by an academic researcher who was putting together a new framework for understanding tax havens, and who persuaded him how important it was to understand the system from the inside. "I went under-cover not to dish the dirt on individuals and companies, but because I couldn't understand it—and none of the academics I spoke to could either. There was no useful literature." He did not even tell his brother what he was doing and kept this cover for
12 years. He grew roots: He became president of the Jersey Film Society, raced high-speed catamarans, and started a family. He never made a secret of his distaste for the system, but his lighthearted capers, such as founding the island's first and only Jean-Claude Van Damme Appreciation Society, helped politicians to see him as a lightweight and therefore not a threat.

When he was appointed economic adviser in 1987, he began to feel the full force of what it means to stand out against an accepted, all-embracing consensus. Occasionally, he said, the pressure was so severe that he physically lost his voice. "Tension gets me around my neck. At times, in meetings . . . there were moments when I was literally choking with anger. It took real strength to stand up and say 'I'm sorry, I don't agree with this.' I felt like the little boy farting in church: I felt so lonely during those committee meetings; nobody ever supported me."

Many people who came to see him as economic adviser wanted him to join their Masonic lodge, and he frequently received the secret signal. "It was a finger twisted back on itself in a handshake," he said. "These were mainly people I knew vaguely, who would come into my office: 'Blah blah,' general talk, then quite openly: 'Are you interested in joining this lodge?' I always said I would consider it, and I never did. The type of people doing this were bankers, senior merchants, and senior politicians. You don't look at people's hands: you feel a lump there when you shake. For me it felt slightly dirty—covert, as if we were all part of some dirty deal; a schoolboy thing."

"Their thinking is very much of the Old Boy network—you are either one of us, or you are against us," he continued. "It means they can trust you to do the right thing without having to be told—an insidious meaning of the word trust." He was labeled untrustworthy and was frequently called

"Not One of Us." The media was captured. The dominant newspaper in Jersey was owned for many years until 2005 by a company chaired by Senator Frank Walker, head of the powerful Jersey Finance and Economics Committee and one of the most vociferous cheerleaders for Jersey's finance industry. As a Financial Times editorial said in 1998, "That is akin to [UK Chancellor] Gordon Brown or [Germany's finance minister] Oskar Lafontaine owning all their country's national newspapers. Few on Jersey see it as odd."[4] Walker left the newspaper in 2005, and it does carry dissenting views and plenty of decent reporting. Yet its overall editorial tone and content staunchly favor the tax haven industry.

Patrick Muirhead, an experienced former BBC radio journalist who spent time as the anchorman of Jersey's nightly ITV news until 2004, described the atmosphere.

"In an island of 90,000 souls, one is only removed from another by the smallest step of separation," he said. "My co-host's home became a popular salon for politicians and decision-makers. In such an atmosphere of closeness, any meaningful challenge becomes impossible. 'You rub people up the wrong way,' she said, primly dismissing my methods. After I left, my integrity, professional ability and popularity were trashed by a hostile and defensive Jersey media and island population."[5]

Unaccountable elites are always irresponsible, and I got my own taste of Jersey's moldy governance on the very first day of a visit in March 2009, when I bought the Jersey Evening Post and read its front-page story, entitled "States in Shambles."

"The States resembled a school playground yesterday as foul language and personal insults flew across the chamber," read the text. Senator Stuart Syvret, a popular but controversial local politician, had complained publicly in the States assembly, Jersey's parliament, that the health minister was whispering in his ear. Syvret, the newspaper reported, "stood up and said: 'On a point of order, I am sorry to interrupt the minister. But the minister to my right, Senator Perchard, is saying in my ear "you are full of f*****g s**t, why don't you go and top yourself, you bastard." Senator Perchard immediately responded by saying: 'I absolutely refute that. I am just fed up with this man making allegations.' The BBC, which was broadcasting the sitting live, had to apologise for

the language."

Syvret has been a regular victim of efforts to suppress dissent. "Any anti-establishment figure here is bugged," said Syvret.[6] "There is a climate of fear. Anyone who dares disagree is anti-Jersey, an enemy of Jersey. You are a traitor, disloyal. There is all this Stalinist propaganda." A few weeks after my visit, eight police officers arrested him and jailed him for seven hours while they ransacked his home and personal files, including his computer files. The next day Syvret's blog administrator told him someone had clumsily been trying to hack his passwords. His blog describing his incarceration summed up the atmosphere. "Come to Sunny Jersey. The North Korea of the English Channel!"

In October 2009, having been accused of leaking a police report about the conduct of a nurse, Syvret fled to London and claimed asylum in Britain. He returned in May 2010 to fight an election and was arrested at the airport. Not long afterward, he outlined his views about Jersey plainly.

"It is an utterly lawless jurisdiction. Jersey is an environment under the grip of a wholly criminal regime. So absolute—and absolutely corrupted—is all meaningful power in Jersey that the island possesses less scrutiny and fewer checks and balances than a Balkan state."[7]

Corruption could tarnish Jersey's international reputation. Skittish financiers dislike places that are chaotically corrupt, as do onshore regulators elsewhere. Secrecy jurisdictions steeped in sleaze confront this by putting on a strenuous theater of rectitude that involves repeatedly projecting the essential message that they are clean, well-regulated, transparent, and cooperative jurisdictions—burnished by carefully selected comments and praise from toothless offshore watchdogs like the IMF's Financial Action Task Force or the OECD.

It is hard to construct coherent intellectual justifications for hosting secretive offshore finance, so the usual technique is to engage the messenger, not the message. Attacks on dissidents mostly consist of mean-spirited little slurs and innuendoes: "This person is ignorant, motivated by envy, economically illiterate, unreliable, or mentally unbalanced; this person cannot be trusted." Geoff Southern, a dissident deputy, said he now tries to avoid pointing in public: Last time he did he appeared in the Jersey Evening Post in a stunningly Hitler-like pose. He and his friend, Senator Trevor Pitman, wearily describe being tarred with terms like "Destroyers of Jersey" or "The Enemy Within": They are accused in public of being driven by personal bitterness; hints are dropped about darker motives. When we spoke, both Southern and

Pitman's wife, Shona, another deputy, were being prosecuted for helping elderly and disabled residents fill in requests to opt for postal votes, albeit in breach of an arcane electoral law. They were later found guilty and fined. The amorphous finance industry is, locals say, ultimately behind the

attacks. “The finance industry is like an amoeba,” said another Jersey politician, who declined to be identified. “You attack it, and it absorbs that, and attacks back. It is the parasite in the island. It has taken it over; it controls us and decides on everything that happens here.”

John Heys, a tour guide at Jersey’s world-famous Durrell Zoo, and his friend Maurice Merhet, a former printer and pig farmer, now retired, tell a similar story. “We live in a dictatorship,” Heys said, jabbing his finger at the table. “This is not a democratic country. John Christensen is public enemy number one. We call them the Junta, and people are afraid to stand up against them.” Heys showed me an email sent by a government minister to a dissident friend who had, in a cheeky Christmas message, pointed out the large sums stashed in secrecy in Jersey, amid global poverty. The minister responded—mistakes included:

> Hi
> Trait
> or
> Please refrain from sending me your unsolicited garbage . . . I am surprised you still decide to live in this “tax haven” island.ifs its so bad why do you not leave to live somewhere else . . . good riddance I would say…. but perhaps NOT because you get a damm good living here no doubt perhaps funded by banks and your morgage lende r . . . in fact my family have lived in Jersey for several generations and I am so very proud of it but to listen to traiterous idiots like you makes me furious. .
>
> I would not have the nerve to wish you a happy christmas in fact I hope you continue to to live a miserable existence in your traiterous world
> Do not respond

In tiny states everyone knows everyone else, and conflicts of interest and corruption are inevitable. There are no independent think tanks or universities; a small and vulnerable civil service; no clear division among the legislature, the judiciary, and the executive; and no second chamber to scrutinize the States Assembly’s deliberations. When Christensen was Economic Advisor, the public could not attend committee meetings and there was no written record of parliamentary debates on major laws. These problems extend to the governance of the finance industry. In Jersey there are no credible and truly independent processes for internally scrutinizing or regulating offshore

finance. A 2002 publication from the Association of Accountancy & Business Affairs, one of the most detailed academic analyses of Jersey's politics, puts it concisely. "Most Jersey politicians are in business," it said. "They lobby for business and promote business interests. They draft, refine and pass legislation. They have also sat on regulatory bodies, effectively acting as 'gatekeepers' adjudicating on complaints and malpractices. Politicians sit on the boards of the companies that they are supposed to regulate."[8]

Close relationships are inevitable in a small island, but it is precisely because of this that Jersey needs extra checks and more transparency, to weigh against the inbuilt tendency toward conflicts of interest. This is especially important when Jersey plays such a major role in international finance. This affects you and me.

Extreme economic inequalities are tolerated offshore—and often welcomed as incentives for the poor to work harder. It is an ethos memorably summarized by the economist J. K. Galbraith as "the 'horse and sparrow' theory of income distribution and tax: if you feed a horse enough oats, some will pass through to the road for the sparrows."[9]

This soak-the-poor attitude is a constant theme as Jersey seeks to stay ahead of other jurisdictions in its race to attract capital. In 2004 Jersey cut the corporation tax rate from 20 percent to zero, except for finance, which pays 10 percent. This tax cut blew a hole in the budget big enough to finance Jersey's entire benefits system, so they made hundreds of redundancies and introduced a tax on consumption, hitting the poor especially hard. Shona Pitman, a States deputy, calls this the "tax the poor to save the rich" approach.

Super-wealthy people and corporations can actually negotiate the tax rates they will pay. For most of the 1990s, wealthy people wanting to take residence sent their lawyers directly to Christensen's office to negotiate their rates. Jersey would insist on a minimum annual tax payment, and the millionaire or billionaire would then simply remit to Jersey the amount of money that, when calculated at Jersey's flat 20 percent tax rate, would reach this sum. Christensen's predecessors had settled on a £25–
30,000 tax payment each time; Christensen raised this to £150,000—which meant remitting income of £750,000 each year to Jersey. If you had worldwide income of £10m, say, your effective tax rate would really be 1.5 percent. A similar principle applies to corporations. For a Jersey International Business Company, the top rate starts at 2 percent and falls from there depending on how much profit they plan to book in Jersey.[10]

"Jersey has the social structure of a Hilton hotel," explained Jerry Dorey, a Jersey senator. It contains "a collection of alienated individuals who are just here to make money."

At the time of writing, six of Jersey's ten ministers are multimillionaires. "This is a parliament of wealthy people," said the dissident Jersey deputy Geoff Southern. "I think there is still a resentment that peasants have got into power."

One winter night in 1996, toward the end of his time in Jersey, Christensen opened the books for a reporter from the Wall Street Journal who was investigating a fraud ring involving a Swiss bank operating out of Jersey that had been ripping off American investors and who posed some very precise questions. The story, entitled "Offshore Hazard: Isle of Jersey Proves Less Than a Haven to Currency Investors," ran on the Journal's front page several months later.

Jersey's finance industry and politicians went into spasm: This was one of the first times Jersey's supposedly clean and well- regulated finance sector had been challenged in a serious global newspaper. The end of the article quoted a senior civil servant who, everyone in Jersey knew, was Christensen. He knew that in talking to the reporter, he was effectively resigning.

"From then on, they would have done anything to get rid of me. But I had tenure: The only way they could do it was to find me guilty of professional misconduct or in bed with a choirboy. The tension was incredible." He did not leave immediately: His second son was born the following month, and it took him some time to serve out a long notice period.

Now that he is a dissident, the barbs continue to fly across the English Channel. "Grapes come no sourer than those trodden by Mr. Christensen, who once worked in Jersey and was passed over for promotion," the Jersey Evening Post thundered later. "Ever since, he has worked unceasingly to undermine the Island that foolishly slighted him." A quote from Jersey, published in France's Le Monde newspaper in April 2009, called him a "traitor to the nation." He attacks Jersey, the whisper goes, because he was not promoted as chief adviser. Insiders in the Jersey establishment have confirmed that it is semi-official policy to attack him in exactly these terms.

Offshore thrives on narrow self-interest combined with a culture of collusion. Its defenders are neurotically quick to impute mean motives

and a hidden agenda to their critics. But men angling for promotion do not usually speak freely with the Wall Street Journal as they raise their voices in dissent.

The offshore intolerance is not confined to small jurisdictions. Rudolf Elmer, a Swiss banker who worked for several banks in several offshore centers before becoming a whistle-blower on some of the corruption he had seen, felt the pressure in Switzerland, a country of 8 million people.

Not long after speaking out and returning to Switzerland, he began to notice two men following him to work. He saw them in the parking lot of his daughter's kindergarten, then outside his kitchen window. Then his wife was followed, and the men offered his daughter chocolates in the street. In 2005 he was imprisoned for thirty days, accused of violating Swiss bank secrecy. There has been no determination as to who might have been following him.

"I was bloody naive to think that Swiss justice was different," Elmer said. "I can see how they might control a population of eighty thousand people in the Isle of Man," he said. "But 8 million people? How can a minority in the banking world manipulate the opinion of an entire country? What is this? The Mafia? This is how it works. Jersey, the Cayman Islands, Switzerland: this whole bloody system is corrupt."[11]

Ruling class ideologies that for years were beyond the pale in the larger democracies have been allowed to grow offshore, without restraint. As offshore finance has grown increasingly influential in the global economy, rebounding back and reengineering the onshore economies in ever more significant ways, so its attitudes have flourished, gaining the strength and confidence to capture the perceptions and attitudes of public life. This offshore consensus is evident in the intransigent arrogance of bankers who, having nearly brought the world economy to its knees, ask for still more and continue to threaten to relocate elsewhere if they are regulated or taxed too much. It is visible in the demands of the super-rich, who have come to expect and demand tax rates below those of their office cleaners. It is visible in the actions of the Irish musician Bono, perhaps the world's most prominent poverty campaigner, who legally shifts his financial affairs offshore to the Netherlands to avoid tax and is still warmly welcomed in high society. The United States, the greatest democracy the world has known, is now in thrall to the worldviews of unaccountable, abusive, and often criminalized elites.

To a very substantial degree, indeed, we have offshore finance to thank

for that.

RATCHET
How Secrecy Jurisdictions Helped Cause the Latest Financial Crisis

THE PRACTICE OF USURY, OR THE LENDING OF MONEY at excessive interest rates, has a nasty historical taint. The prophet Ezekiel included it with rape, murder, and robbery in a list of "abominable things." Plato and Aristotle called it immoral and unjust, and the books of Exodus, Deuteronomy, and Leviticus forbid it. In Dante's Inferno, "lewd usurers" sit in the seventh circle of hell, and the Koran states that "whoever goes back to usury will be an inhabitant of the Fire." When the ancient Greeks deregulated interest rates, indebted Athenians ended up being sold into slavery.

One can argue about the merits and evils of usury, but in a deregulated market the poor and vulnerable inevitably pay the most. Annualized rates of 400 percent or more are not uncommon.

Historically, the United States regulated lending rates carefully. In 1978, however, a new era began when the First National Bank of Omaha started enrolling Minnesota residents in its BankAmericard Plan. At the time, Nebraska let banks charge interest up to 18 percent a year, while Minnesota's usury limits were 12 percent. Minnesota's solicitor general wanted to stop the bank from charging higher interest rates. Could the Nebraska bank "export" the 18 percent rate to charge Minnesota residents?

The Supreme Court ruled that it could—and Wall Street noticed. If one state removed interest rate caps entirely, Wall Street could export this deregulation across the United States. Then in March 1980, South Dakota passed a statute eliminating its anti-usury interest rate caps entirely. The statute was, according to Nathan Hayward, a central player in this drama, "basically written by Citibank." A new opportunity for U.S. banks had opened up: By incorporating in South Dakota, they could roll out credit card operations across the country and charge interest rates as

high as they liked.

Then came Delaware. The tale of its Financial Center Development Act of 1981 is a story about 10–15 powerful people who came together to pass an enormously significant piece of legislation, from which many of them, along with friends and colleagues, reaped huge wealth.[1]

David Swayze, a grizzled and affable lawyer who was chief of staff to Delaware's then governor, Pierre S. "Pete" du Pont, picks up the story.

"What Citibank did [in South Dakota] was not lost on the other money center banks," Swayze said. "They wanted some—but they didn't want to be in South Dakota. It's cold out there."

Hayward, who is du Pont's second cousin and was a du Pont cabinet member at the time, picks up the story. "Pete [du Pont] inherited a state that was in bad financial shape," he said. "There had been a continuous stream of red ink and the deficits were hidden with tricks and budget games." After being elected governor in 1976, du Pont had overseen an improvement in state finances, and he was a shoo-in for reelection. "We weren't on a cocaine high," said Hayward, "but we were beginning to feel pretty good."

In early June 1980, a group from Chase National Bank came to the venerable University & Whist Club in the state's commercial capital, Wilmington, to meet Delaware officials.[2] The link man was Henry Beckler, an ex-Chase banker at the Bank of Delaware, and he had already persuaded Chase to manage some of its foreign operations out of Delaware. "Henry Beckler's son and my son went together to school," said du Pont. "When you put a statute like this together you have to talk to the banks. He was very important, he asked them what things we should be putting in there."

Du Pont, who is reminiscent of an aging, if less handsome, Mitt Romney, comes from a family that has dominated Delaware politics for over a century, and he seems to have been a surprisingly passive player given his position. His memory of the episode was not so fresh, and he is clearly not a detail guy: Three or four times when asked to explain the episode he replied vaguely, ending by saying something like, "It was good. It was very good." When challenged about certain Delaware corporate forms offering ironclad secrecy, he offered no detailed rebuttal, just: "I don't think that's right. It all works nicely." But he did put his finger on one important element of the process: the small-town groupthink that let it happen. "One of the nice things about Delaware is that it's a small state," du Pont said. "We all have the same ideas."

Hayward says the aim of the June meeting was "to listen to New York

bankers who were friends of the Delaware bankers who had helped us. They said, 'We'd love it if Delaware allowed market rate banking.'"

The Chase team wanted this rushed through in a few weeks, well ahead of the November 1980 gubernatorial elections. That was too tight. But what happened next was remarkable. Confirmed by several interviewees, by a 1981 New York Times investigation,[3] and by du Pont's official biography, it is a testament to the ability of elites in small offshore jurisdictions to create and sustain a consensus in their favor.

Frank Biondi, a powerful Democrat lawyer,[4] and Chuck Welch, du Pont's general counsel, went to see Hayward. "[They] said that the locker room on this was very small," Hayward remembers. "If the idea got out in public, the Democratic candidate for governor, a downstate farmer named Bill Gordy, is going to grab onto this and the Democrats in the House and Senate will make this a big campaign issue. We'll lose the battle before we even get suited up in our armor."

Du Pont was popular, and Republicans weren't that worried about the state election, but they did fret that if this story got out, it might affect the campaigns of other Republican candidates, including U.S. presidential nominee Ronald Reagan.

"Gordy was one of the unsung heroes of the whole story," Hayward continued, "a good old pig farmer. Frank [Biondi] and Chuck Welch got into a helicopter in Wilmington and went to see him and said, 'Bill, we want you to know what we're working on. We're here to ask you to keep your mouth shut and not make it an issue in the campaign.' Bill Gordy, God bless him, said yes."

The entire Democrat establishment in Delaware seems to have bought into the silence. And not just them. "If you go back and read the News Journal," said Hayward, "you will not find one mention of it in the press in the campaign season."[5] This

proposal was circulating among Delaware's entire top business and political elite, including a couple of "populist" legislators who saw this—usury—as a threat to the basic consumer. "We had all these major bankers in Delaware through the whole summer," said Glenn Kenton, another key player, reeling off names like Citicorp's CEO Walter Wriston and Chase's president Tom LaBreque. "Nobody found out about it. It's just an amazing thing."

Still, inside this rarefied secret circle, a pushback did materialize. "The most significant counterforce, though not overt, was the local banks," said Swayze. "In the cold citadels of privilege there was a fear the big banks would run rings around them."

Wall Street began to apply pressure. Chase stiffened Delaware spines at a meeting at the Wilmington Club in June, threatening to pull up stakes for South Dakota.[6] "The banks would come down and say, 'Now if we come [and build these institutions], are you guys, meaning the government, you're not going to cut us off at the knees here?'" du Pont explained. He agreed to form an informal task force to look into Chase's plan and promised to reply by September.

In the end, Wall Street and Delaware's bankers settled on a compromise. To protect the local banks, they promised clauses to prohibit the outsiders from touting for local retail business. By mid-August the local banks were on board, and the task force turned to the legislative process. A special session of the legislative assembly was called outside of normal procedures to insulate this from the democratic process. As the Delaware Lawyer explained it, the special session's purpose "was to prevent the proposal from becoming encumbered in the 'horse trading' that typically occurs in the regular session."

While bigger states saw laws regulating economic activity as complex moral, political, and economic issues, Delaware was seeing them instead through an offshore lens: as pieces of sovereignty that could be sold to make locals rich.

Chase had opted for Delaware, not South Dakota, partly because it did not want to be following in Citicorp's slipstream. "Chase said, 'We're not going to the same place Citicorp is going,'" Kenton remembered. Citicorp, he added, had said we're "only out in South Dakota because we had to go someplace. But if you are going to open up, count us in too."

As Wall Street interest grew, Delaware kept brainstorming for still more business. Biondi suggested talking to JP Morgan, where he had some connections: It did not issue credit cards, but Delaware hoped to find other business. “We went up to see Morgan and we said, ‘What do you want?’” Kenton explained. “And they said, ‘We’re just getting the heck taxed out of us up here and we need to have a low-tax environment.’” So Delaware served up the offshore classic of a regressive state tax structure: the richer you are, the lower your tax rate. They set the bank franchise tax at about 8 percent on income under $20 million, then 6 percent on $20–25 million, and so on, until the really big incomes got away with just 1.7 percent. The goal, as Swayze put it, was “sheltering the indigenous banking community against competitive threats on the one hand, and attracting and growing the business of newly created Delaware bank subsidiaries of non-Delaware bank holding companies on the other.”[7] As for the lost tax dollars from the banking behemoths—well, American taxpayers elsewhere could pick up the tab for that.

Biondi’s firm Morris, Nicholas, Arsht & Tunnell represented both Chase and JP Morgan, and both he and his firm are frank about their role in the local bonanza. “The Chase Manhattan and J. P. Morgan banks hired Morris, Nicholas’s Frank Biondi to draft the law,” the firm’s official history notes, “and help convince the state legislature to adopt it.”[8]

Biondi himself adds, “Did I lobby the state legislature? You’re damn right I did.”

So Chase and JP Morgan, in effect, wrote the law through their local representatives. The NewYork Times noted later that it was drafted without any written analysis by a Delaware official, and that Biondi’s drafts got their primary reviews from other bank attorneys.[9] Biondi denies any conflict of interest, saying he disclosed his connections to all parties.

On November 4, 1980, du Pont was reelected as governor of Delaware, and the draft legislation was unveiled in public two months later, on January 14. Du Pont’s administration gave the state general assembly the deadline the banks demanded: pass the bill by February 4 or the deal was off.[10]

The bill sailed through on February 3, and du Pont signed the Delaware Financial Center Development Act two weeks later. Delaware was to remove interest rate ceilings on credit cards, personal loans, car loans, and more. Banks would have powers to foreclose on people’s homes if they defaulted on credit card debts; they could establish places of business overseas

or offshore, and they got a regressive state tax structure to boot. And crucially, because Delaware law could now be "exported" to other states, this was to be rolled out across America.

Two hundred years of legislation capping interest rates in the United States had now lost all force.[11]

Despite the timing—the bill was passed less than a week before Ronald Reagan took office as U.S. president—all interviewees stressed that this came purely from Delaware and the New York bankers, not from Washington. "Lawmakers quickly realized," wrote du Pont's biographer, "that the Financial Center Development Act was favored by almost everybody in the state's power structure—and by the powers most likely to contribute significantly to their future election campaigns."[12]

Out-of-state banks flooded into Delaware, and the credit card industry took off. Within months the credit card giant MBNA had opened its first office in a vacant supermarket; within a decade it had over $80 billion in outstanding credit card debt. "Every night helicopters took off from here carrying receipts and paperwork from all the credit card business," said du Pont. "It gave us 25 years of growth and revenues growing every year." Before 1980, Delaware's revenue just from the bank franchise tax had trickled in at just $3 million–odd per year. By 2007 it was taking $175 million.[13]

Just as Ronald Reagan prepared his assault on America's unions, American workers began to trade their union cards for credit cards.

Two months after the bill's passage, the NewYork Times summed up.[14] "To bankers and their supporters the law is modern and comprehensive, drafted in a thoughtful manner. To some state officials, legislators and consumer advocates, both in Delaware and elsewhere, the bill was stampeded through the Delaware Legislature, is one-sided and, as one critic put it, a banker's 'dream.'"

"Bankers say the possibility that the Delaware plan could be enacted in other states is a sign of healthy competition among the states and a reflection of the current emphasis on states' rights," continued the article. "Their critics say it illustrates the ability of powerful private interests to pass laws with national ramifications by singling out and exploiting the weakest and most malleable states."

The same Times article noticed something else. "Many legislators say they did not read the 61-page bill before agreeing to sponsor it and did not understand the complicated measure before voting on it." Harris B.

McDowell, the majority whip for the

Democrat-controlled Senate, said he was told at the last minute. "I confess I have no expertise in the banking area," he said. "I am mystified by the bill." He voted for it on a promise that it would create jobs. Others said the only hearing for the bill, which lasted just three hours, was handled and timed in ways that prevented many legislators from attending and inhibited rebuttal. Delaware's Consumer Affairs Department never saw the bill before its passage, a deliberate exclusion that Kenton defended by saying that he and du Pont shared the "bias" that "banks should charge what they want in fees."

> "I didn't see any sense in running that fundamental principle by anybody who doesn't agree with it," he added.

This pattern will be familiar to offshore legislators worldwide. In Delaware, bankers had found a small and malleable legislature, used special legislative tricks to stymie bothersome objectors from other stakeholders, worked hard to keep objectors in the dark, reassured bamboozled legislators that all would be well, and created "ring-fences" giving special exemptions to outsiders that were not available to locals.

Most important was this typically offshore feature that made all these things possible. "It's small, you can get the leadership together because of that," Biondi said. "The leadership was accessible at the governor's office but also in the legislature and in the business community." Du Pont made exactly the same point. "I used to say to them, if you've got a problem, you come on in and around this one table, we can put together all the people we need to solve your problem, whatever it may turn out to be. And we'll talk about it. We're small enough. We can move fast. We can get things done."[15] Swayze agreed and added a detail. "There were significant forces in the New York legislature opposed to this," he said. "Delaware took advantage of the fact that New York couldn't turn the dreadnought around in the harbor. We're small, we take advantage of opportunities, and we can fill that void."[16]

> In other words, we can give the bankers what they need, faster than anyone else. Delaware is a legislature for hire.

Once Delaware fell, the banks then wielded it as a crowbar against other states. Thomas Shriver of the Pennsylvania Bankers Association warned that Delaware is "a very viable option if the Pennsylvania Legislature doesn't enact a bill we have proposed." Robert Erwin, head of Maryland's consumer protection division, warned that if other states gave in to the "pressure" from Delaware, "then it becomes a game of Russian roulette among the 50 states, trying to outdo themselves."

With interest rates caps removed, the credit card industry took off, and Americans splurged on debt. By mid-2007, as the global financial crisis emerged, U.S. consumers owed nearly $1 trillion on their credit cards[17]—and that is not to mention loans people took out against their homes to pay the credit card bills. Not a single one of those interviewed for this book who were involved in the passage of the Financial Center Development Act showed any signs of doubt that it was a very good thing.

The respected liberal lawyer Thomas Geoghegan points to the significance of this episode.[18] "Some people still think our financial collapse was the result of a technical glitch—a failure, say, to regulate derivatives or hedge funds," he wrote. "No, the deregulation that led to our Time of Troubles was of a deeper, darker kind. The problem was not that we 'deregulated the New Deal' but that we deregulated a much older, even ancient, set of laws . . . the laws against usury, which had existed in some form in every civilization from the time of the Babylonian Empire to the end of Jimmy Carter's term, and which had been so taken for granted that no one ever even mentioned it to us in law school. That's when we found out what happens when an advanced industrial economy tries to function with no cap at all on interest rates."

This probably overstates the case: There is no single explanation for the latest crisis. Still, Geoghegan has identified an important contributing factor. The elimination of usury caps spilled out into a wide variety of financial fields.

Credit card debt, money market funds, and numerous other instruments that fueled the borrowing binge and the crisis—the removal of interest rate caps—had effects that are incalculable.

Having helped deregulate and boost the supply of debt, Delaware also set about getting a share of the demand side. It did this by setting itself up as a major player in the securitization industry—the business of parceling up mortgages and other loans, including on credit cards, and repackaging the debt and selling it on. Once again, Delaware did this simply by establishing the exact legal framework that corporations demanded.

The Delaware Financial Center Development Act of 1981 itself contained a section eliminating "affiliated finance companies" from all state taxes. These act like banks but aren't formally banks, so they fall

outside banking regulations. Along with structured investment vehicles and their like, these are a core part of the global "shadow banking system"[19] that dragged the world into economic crisis from 2007. These companies were especially prominent in the United States, notably in Delaware. In 1983 a new International Banking Development Act got Delaware into the new offshore game of international banking facilities. When that was enacted, Chase and several other banks promptly moved foreign offshore activities to Delaware.

Biondi outlines several other statutes that followed and his role in them.

"I wrote those bills with my boys here," he said. The 1986 Foreign Act Development built on the 1983 legislation designed to let foreign banks take advantage of Delaware's regressive bank franchise taxes. New tax legislation in 1987 enticed banks that wanted to get into dealing securities. "My staff and I wrote it," Biondi explained. "We represented Morgan, Chase, Citicorp, Bank of New York, and Bankers Trust." Biondi's team also wrote the Bank and Trust Company Insurance Powers Act of 1989, authorizing banks to sell and underwrite insurance.[20] The Delaware Statutory Trust Act of 1988, giving huge flexibility to people setting up such trusts, and "the protection of trust assets from creditors," made Delaware the top jurisdiction for setting up so-called Balance Sheet CDOs, which allowed banks to offload their assets onto other investors and were another important contributor to the crisis.[21] A new act in January 2000 allowed Limited Liability Partnerships: a major contributor to the degradation of corporate governance, which I will soon explore in detail. There was also the Asset-Backed Securities Facilitation Act of 2002, which further opened the securitization spigots.

All these helped Delaware become, as one expert put it, "The Jurisdiction of Choice in Securitisation."[22]

Even more broadly, Delaware has played a central role in transforming global banking from its traditional fare of funneling savings into productive investments toward more speculative, risky, fee-based banking models. "Delaware recognized the quantum shift in the financial services industry toward fee based activities," said Swayze, "and it provided the legislative and regulatory framework to accommodate that shift."[23]

Now here is the big point. I do not claim that this story constitutes an explosive new revelation about the ultimate causes of the latest mortgage and financial disasters. This was just one among the many

tangled roots of the crisis—though an important one. My point is to show just what a tax haven is: a state captured by financial interests from elsewhere. Mark Twain said that

history does not repeat itself—but it rhymes. My next story, from thousands of miles across the Atlantic Ocean in the British tax haven of Jersey, rhymes almost perfectly with this tale from Delaware.

In June 1995 the director of Jersey's Financial Services Department met with a partner in Mourant du Feu & Jeune, a member of the so-called "Offshore Magic Circle," made up of the ten or so law firms most active offshore. They discussed a corporate form known as the Limited Liability Partnership (LLP).

A letter then began to circulate in Jersey political circles, dated October 9, 1995.

"My firm has been working with the UK partnership of Price Waterhouse (PW) and English solicitors, Slaughter and May, to find a method of obtaining some limited liability protection for the partners' personal assets without completely restructuring PW's business and losing the cultural benefits of a partnership," the letter said. After surveying several jurisdictions, it continued, Jersey was deemed the most suitable. "We are therefore seeking support of your Committee for the introduction of a Special Limited Partnership Law in Jersey during 1996."

In short, the private firms wanted to write a new law for Jersey. In fact, a draft law had already been prepared in London.

The letter urged Jersey's powerful Finance and Economics Committee to consider the law by December, then have it debated in the States Assembly the following January or February. "We would also propose that we would prepare any necessary subordinate legislation required in connection with the Special Limited Partnership Law. We appreciate that this is a very short time scale."

"It would be very important for PW and I believe, Jersey's finance industry, that the correct messages are sent to the media," the letter continued, proposing that Jersey's PR firm Shandwicks and Price Waterhouse's media team get straight to work.

The Big Four accounting firms—PricewaterhouseCoopers (PWC), Ernst & Young, KPMG, and Deloitte Touche—are giants: PWC employed over 146,000 people and generated $28 billion in revenues in 2008, making it the world's largest professional services firm. Auditors also occupy a very special place in the global economy. Their audits are the main tools by which societies know about, and regulate, the world's

biggest corporations: In a sense, they are the private police forces of capitalism.[24] Audit failures lie behind most great corporate scandals: Enron, WorldCom, and most of the collapses related to the latest financial crisis. Because of the extreme dangers bad audits pose to corporate capitalism in general, and to you and me in particular, governments try to regulate this profession with extra care.

Since the middle of the nineteenth century, limited liability has been part of a grand bargain at the heart of corporate governance. If a limited liability company goes bust, owners and shareholders may lose the money they invested, but their losses (or liabilities) are limited to that: They are not liable for additional debts the corporation has racked up. This concept was controversial when it was first introduced: It was feared that it would erode standards of accountability, but it was justified on the grounds that these investor protections would encourage people to invest and boost economic activity. But there was a caveat: In exchange for the gift of limited liability, corporations must agree to have their accounts properly audited, and have these audits published, to open a true and fair window into what they were up to. It was an early-warning system to keep the risks manageable.

By contrast, a general partnership is very different from a limited liability company. Investors in a partnership are experienced professionals who should know what they are doing, and they have unlimited liability. When things go wrong they are personally liable for all losses: Creditors can theoretically take even the shirts off the partners' backs. Since they have given up the right to shift losses onto the rest of society, partners are held to less stringent standards of disclosure. Partners were also subjected to "joint and several" liability, in which a partner is liable not only for his or her own mistakes but also for the mistakes of others in the partnership.[25] All this helps focus auditors' minds on doing their job properly—and to police their colleagues too.

Konrad Hummler, the managing partner of an unlimited liability company, Wegelin Private Bank, in Switzerland, explains what it is like to operate under such rules.[26]

"Partners who have [joint and several] unlimited liability have a solidarity; the dynamic within the group is totally different," Hummler said. "On so many boards—and I have quite some experience of this—one doesn't dare to ask the right questions. This [unlimited liability] is the only way of doing business where you dare to ask the really difficult questions—mostly the simplest questions. I will say, 'Listen, Mr. Chairman, I still don't understand the case.' The chairman will say, 'You

obviously haven't read your papers properly.' At this point I don't stop the discussion, but I say again, 'Mr Chairman I still don't understand this bloody thing.' That's the difference. Because of your unlimited liability, you think twice."

Joint and several unlimited liability for partners in audit firms is clearly, given their special role in policing modern capitalism, a very good idea.

What was being proposed in Jersey, however, was different again: a law allowing limited liability partnerships (or LLPs.) An LLP for accountancy firms is an example of having your cake and eating it: An LLP partner not only gets the benefits of being in a partnership—less disclosure, lower taxes, and weaker regulation—but it gets the limited liability protection too. And if a partner commits wrongdoing or is negligent, other partners who are not involved aren't accountable for the consequences. This law was the product of what Professor Prem Sikka, of Essex University, calls auditors' ultimate aim "to use the state to shield it from the consequences of its own failures."[27] For those involved, it is the best of all worlds. For the rest of society, it is the worst of all worlds.

The draft Jersey LLP Act was worse still. LLPs would not need to have their own accounts audited or even to say on their invoices or letterheads that they were registered in Jersey. It had no provisions for regulating audit firms or investigating misdemeanors, and it offered other audit stakeholders—that is, the public—almost no rights. To get these astonishingly generous concessions from the public at large, these multibillion-dollar global corporations would have to pay a one-time fee of just ten thousand pounds at first, then five thousand pounds a year afterward.

As with the liberalization of usury provisions in Delaware, the Jersey proposal was a delayed reaction to the ideological revolution associated with Ronald Reagan and Margaret Thatcher: a shift away from the view that competitive markets need robust regulation to a childlike faith in self-regulation by market actors.

Big accountancy firms had already gotten LLPs in the United States after first influencing the Texas legislature in 1991; within four years nearly half of U.S. states had it. These limited liability provisions "took away the most powerful incentive for self- policing by the corporate professions of law and accounting," wrote the tax expert David Cay Johnston, and "help explain the

wave of corporate cheating that swept the country."[28] Already there was evidence from the United States that whenever these provisions are introduced, less time is allocated to each audit, and quality suffers. It is nearly impossible to provide a smoking gun in such cases, but these kinds of concessions were undoubtedly important factors in the Enron and WorldCom disasters and in the destruction of Enron's auditor, Arthur Andersen LLP.

In Britain, following high-profile audit failures such as BCCI, Polly Peck, and many others, auditors had already squeezed major concessions out of the government, having won the right in 1989 to be limited liability companies[29]—though few audit companies converted, since many did not want to have to publish their accounts. A British House of Lords decision in 1990 worsened matters, ruling that auditors owe no "duty of care" to any individual stakeholder injured by audit failures.

Still, the UK had been holding out against an LLP law and for once was doing the right thing. "The UK . . . wanted to tell the world, 'You can trust London,'" said Sikka, who researched the Jersey LLP affair. "If it is impossible to sue the auditors, that makes it harder to look clean." The accountants had other ideas. "I think the calculation was that if the UK fell, the rest of Europe would fall, and the former British Colonies would also fall into place. They thought: 'If the UK gets going, everything else is won.'"

The accountants' strategy was simple: find an easy-to-influence legislature offshore, win LLP concessions there, then threaten to relocate there if the UK refused to create its own LLP law. First they approached the Isle of Man, then Guernsey, for an LLP law, but they were turned down. Then they came to Jersey, which is, as Jersey senator Stuart Syvret put it, "a legislature for hire."

A month after that initial letter, Price Waterhouse and Ernst & Young publicly announced the proposed Jersey LLP legislation. Senior Jersey politicians had assured them that the bill would be "nodded through," as one insider notes.

Not everybody was happy. Jersey's senior law draftsman complained that the new law was like "getting a completed crossword and being asked to write the clues." Syvret remembers first coming across the proposed law. "I knew bugger-all about accountancy, and suddenly it was on our desks and we had to debate it in two weeks," he remembers. He and Gary Matthews, one of the only other dissidents in the legislature to smell a rat, set about educating themselves about LLP laws. Matthews contacted a British parliamentarian, Austin Mitchell,

who in turn called Sikka. They soon began to understand what this law meant. Matthews put it bluntly. “This law is poison.”

Sikka remembers Matthews and Syvret first contacting him as they scrambled to get up to speed. “Gary Matthews said, ‘They want to rush this through parliament and I don’t understand a word—and other people I’ve spoken to don’t understand it either.’” “I’d been there on holiday but had taken no interest in this funny little island, until that fateful call from Gary Matthews. The more we looked into it, the more rotten the place looked.”

Matthews and Syvret were up against a well-resourced and motivated establishment on an island whose very political structure makes dissent extremely hard. Jersey has no political parties. The 53 members of the States (or government) are directly elected, but in three separate groups: 12 senators, 29 deputies, and 12 parish constables (known as connétables). Elections are staggered over time, so there has never been a general election or a change of government. There is no tradition of “government” versus “opposition” but instead a permanent regime that evolves over time.

This dramatically weakens opponents of an establishment consensus. “When bad men combine,” the conservative thinker Edmund Burke wrote, “the good must associate; else they will fall, one by one, an unpitied sacrifice in a contemptible struggle.” Without political parties, good men and women are isolated, then picked off.

“Democracy doesn’t work here,” said Geoff Southern, one of few dissident deputies in the Jersey assembly. “There are 53 Members, but nobody can stand up and say, ‘Vote for us and we will do this as a bloc.’ Instead, it’s ‘I am a good bloke—vote for me.’ Manifestos are just candy floss.”[30] Jersey politics is about personalities, not issues; without shared platforms States Assembly members tend to look after themselves rather than embrace common agendas more likely to reflect the public interest. “For the last two hundred years the establishment has cultivated the notion that party politics is wicked, divisive, and harmful,” Southern said. “The media spreads it. If you did a survey, I expect two-thirds would say they think party politics is a bad idea. Propaganda is everywhere. The media here is like in Soviet Russia.”

Voter turnout reflects the absence of local democracy. The 33 percent turnout in the November 2005 election would have put Jersey in 165th position of 173 countries in a world ranking: marginally better than Sudan and far below the 77 percent European average since 1945.[31]

Poorer voters are especially disenfranchised, facing endless little hurdles that deter them from voting. Much of the Portuguese-origin working class subgroup that makes up nearly 10 percent of the population is unaware they even can vote, Southern said; voters must reregister every three years, and he has found dead people on his voters' rolls.

The connétables, by virtue of the parochial system through which they emerge, are intrinsically conservative and inexperienced, and make a powerful voting bloc—voting with the establishment every time. They tend to be small shopkeepers, farmers, guest house owners, and plumbers, and they get into major positions of power, and into the finance sector. When it comes to decisions on whether Jersey should adopt a global standard of banking regulation, they are unable to judge responsibly. A Wall Street Journal article in 1996 noticed, "Jersey is an island that until two decades ago lived off boat building, cod fishing, agriculture and tourism. It is run by a group who, although they form a social and political elite on Jersey, are mostly small-business owners and farmers who now find themselves overseeing an industry of global scope involving billions of dollars."[32] The article goes on to report the judgment of John Christensen, who was Jersey's economic adviser at the time: "By and large they are totally out of their depth."

Christensen remembers a legislature made up largely of small-town politicians with no understanding of the complex currents of international finance and who simply pass legislation through on the nod. "When I talked to the politicians on the Finance and Economics Committee," he said, "time and time again I talked about proposals coming forward. They said, 'I'm being honest John: I don't understand the detail, but I trust the lawyers and the bankers when they say it is necessary.'" The similarities with what members of the Delaware legislature were saying in 1980–81 are striking.

It is as if a vast global financial center had been tacked onto a couple of small-town parish councils in England or a smaller U.S. county. "They can argue at enormous length about the budget for the local pony club," said Christensen, "but a new limited liability law or a new trust law will go unchallenged. It's the captured state."

Syvret also noticed that Senator Reg Jeune, one of the most powerful politicians on the island and a major supporter of the LLP legislation, was simultaneously a consultant to Mourant du Feu & Jeune, the lawyers who had brought in the legislation in the first place: He had a direct

financial interest in supporting it. “I thought, ‘Whoa!’ This is extraordinarily brazen,” said Syvret. “When the States Assembly convened I stood up and said that Jeune has a conflict of interest—a financial interest. Jeune looked as though somebody had shot him. He staggered out of the chamber.”[33]

Syvret came under ferocious pressure from the Jersey establishment to apologize. He declined, was pressed again, and refused again. Another top politician threatened him with “serious implications” if he did not recant, adding, “which is a pity, since you had such a lot to offer.” The politician emphasized the word had, which Syvret took as a threat.

He stood his ground. “I just wasn’t going to take that crap,” he said. He was suspended from parliament, and in States Assembly deliberations in his absence he and Matthews were referred to as “The Enemy Within.” Sikka, for his part, was called “Enemy of the State.”

Senator John Rothwell, responding to Matthews’s concerns, pointed to the Jersey establishment’s approach to ethics. “The Island has done extremely well in projecting an image of low-profile respectability,” he said, “but people in the finance industry, having heard speeches in the House about ethics of government, are getting rather twitchy about what members might embrace.”[34] Rothwell, a public relations adviser by trade, knew exactly what he was saying. Oppose the LLP law and the financial services industries will see Jersey as unreliable—and the money will go elsewhere.

Matthews’s and Syvret’s robust challenges slowed the fast-track passage of the legislation but did not stop it: It was finally enacted in November.

In elections that year, well-financed candidates stood against Matthews under the banner “Don’t Rock the Boat,” and Matthews was vilified in public. He lost his seat and was unable to get a job afterward. He fled to England and his marriage fell apart. As Sikka put it, “They put that man through the mincer.”

On the surface Jersey feels terribly British, and the island’s rulers always say it is a well-regulated, transparent, and cooperative jurisdiction. The reality is shockingly different. It is a state whose leadership has essentially been captured by global finance and whose members will threaten and intimidate anyone who expresses dissenting views.

After the LLP law passed, the accounting firms next opened a new front in London. They publicly threatened to relocate to
Jersey if the UK did not create its own LLP law.

Sikka fought to stop it. “We told the politicians, ‘You can’t concede

this—these firms have held you to ransom,'" he said. He wrote in The Times of how harmful this legislation would be, and that the Jersey card was clearly a bluff. He noted that the big firms would never close up in London, sack their clients and staff, renegotiate contracts, and reopen in Jersey. "If the Government were to concede a liability cap to auditors, it would hardly be able to deny the same to producers of food, drink, medicine and cars. None of this would be welcomed by consumers."

The Financial Times saw the real agenda too. The accountants "want to keep the threat of moving 'off-shore' as a cosh with which to threaten the [UK] government if it fails to come up with a workable LLP law," it said.

But the accountants got most of the British financial press behind them, roundly criticized Sikka, and wielded the old favorite that Britain's government was "anti-business."

The campaign worked. Britain passed its LLP law in 2001. The accountants never did relocate to Jersey: They had simply used it as a crowbar. "It was the work that Ernst & Young and Price Waterhouse undertook with the Jersey government," an Ernst & Young partner crowed, "that first concentrated the mind of UK ministers…. I've no doubt whatsoever ourselves and Price Waterhouse drove it on to government's agenda because of the Jersey idea."[35]

As Sikka put it: "The Jersey sprat had served its purpose, now that the UK mackerel had been landed."[36]

The UK law was not quite as bad as the Jersey one—it involves more disclosure, for example—and perhaps Sikka's campaigning helped. Yet it still drastically diluted auditors' incentives to take care over their accounting. Ernst & Young became an LLP in 2001; KPMG went in May 2002; PricewaterhouseCoopers made the move in January 2003; Deloitte & Touche followed that August. A host of lawyers, architects, and others joined in, getting the tax perks and limited disclosure available to partnerships but with limited liability. Canada took on the LLP law in 1998; it has been followed by New Zealand, Australia, South Africa, Singapore, Japan, and India—to name a few. These different countries' LLP laws can only have contributed to the latest financial crisis. Had auditors faced getting personally into big trouble when they or their partners screwed up, they might not have been so hasty to sign off on all this off-balance-sheet financing.

The Jersey and Delaware episodes are stunningly similar despite happening fifteen years and an ocean apart and concerning entirely different subject matter. Deep truths about global finance are at work

here. Robert Kirkby, technical director for Jersey Finance, described the generic process. “Someone comes up with a new idea but onshore regulation blocks it,” he said. “You can lobby onshore but there are lots of stakeholders: you have to get past them all, and it takes a long time. In Jersey, you can bash this thing through fast. We got the leading edge years ago. We can change our company laws and our regulations so much faster than you can in, say, the UK, France or Germany.” Talking in March 2009, in the depths of the financial crisis provoked by reckless deregulation, Kirkby lauded Jersey’s new unregulated funds regime specializing in securitization—the pooling and repackaging of mortgages and other assets into securities to sell on to investors that has caused such mayhem.

Here in these deregulated offshore zones our democratic controls on finance and business are being hollowed out, year after year, around the world, out of sight.

I have no objection to deregulation in principle, as long as it is a process of genuine—and I mean genuine—democratic bargaining that considers the needs of all affected stakeholders, at home and overseas. What we have in Jersey and Delaware, by contrast, is rampant, uncontrolled deregulation, harnessed to the interests of a few insiders and large corporate players.

Just as European nobles used to consolidate their unaccountable powers in fortified castles, to better subjugate and extract tribute from the surrounding peasantry, so financial capital has coalesced in offshore’s fortified nodes of unaccountable political and economic power, capturing local politics in these jurisdictions and turning them into fast and flexible private law-making machines, defended against outside interference and protected by establishment consensus and the suppression of dissent.

Offshore is not just a place, an idea, a way of doing things, or even a weapon for the finance industries. It is also a process: a race to the bottom where regulations—laws and trappings of democracy—are steadily degraded, as one arrangement ricochets from these fortified redoubts of finance to the next jurisdiction, and the offshore system pushes steadily, further, deeper, onshore. The tax havens have become the battering rams of financial deregulation.

Most people have not yet understood these deep truths about offshore, because of two related confusions.

The first stems from efforts to use technical criteria to define secrecy jurisdictions: tax rates, forms of secrecy, and so on. But these are just

outcomes of the deeper truths. Our maps of offshore need to identify, first of all, these strongholds of financial

power. A definition like my loose one—that secrecy jurisdictions are places that seek to attract money by offering politically stable facilities to help people or entities get around the rules, laws, and regulations of jurisdictions elsewhere—helps us see what we are looking for.

A second confusion is to think that this is about physical geography, when it is really about political jurisdiction and trust- based networks. The future that the offshore system promises has a distinctly medieval quality: In a world still nominally run by democratic nation-states, the offshore system is more like a network of guilds in the service of unaccountable and often criminal elites.

These stories of Delaware and Jersey should serve as a warning to larger economies about what happens when the offshore ethic isn't challenged.

The Delaware story is one part of an explanation of how offshore contributed to the latest financial crisis, and the Jersey example helps explain why nobody saw it coming. Both of these jurisdictions got rich by eroding standards in the service of financial capital. The consequences are not just insidious but devastating.

In considering how the offshore system contributed to the financial and economic crisis, it's useful to look at the issue of debt. Why has so much debt built up in the world's richest economies? An article in the Financial Times in June 2009 ("Debt Is Capitalism's Dirty Little Secret") provides one answer. "The benefits of economic growth have gone into the pockets of plutocrats rather than the bulk of the population," the article reads. "So why has there been no revolution? Because there was a solution: debt. If you couldn't earn it, you could borrow it." As we have seen, the infrastructure was put in place to make this change happen. The tax havens were a big part of it.

As the 1990s progressed, occasional expert warnings about systemic, debt-related threats from offshore did emerge.

The IMF pointed squarely at the problem in 1999 when discussing the interbank market, where banks lend to each other. "A large part of the growth in OTC trading of derivative instruments may have involved offshore banks," the IMF said.[37] "The interbank nature of the offshore market implies that, in the event of financial distress, contagion is

likely…. Offshore banks are likely to be highly leveraged, that is less solvent, than onshore banks." The report, which contains plenty more along these lines, frets especially about lax offshore regulation. It was a direct warning, long before the crisis struck.

That report followed soon after the implosion of the hedge fund Long Term Capital Management (LTCM), a classic slice-and- dice offshore structure that nearly destroyed the U.S. banking system in 1998 after the fund took on massive risks, covered by near-paranoid secrecy. LTCM's managers were in Greenwich, Connecticut; the hedge fund was incorporated in Delaware; and the fund it managed was in the Cayman Islands. Yet none of the agonized analyses that followed took any serious interest in the offshore angle.[38] And the pattern just keeps being repeated.

The latest financial crisis was incubated in the so-called "shadow banking system"—a vast, unregulated economic terrain containing all manner of Special Purpose Entities (SPEs, also known as shadow banks) that borrowed money to lend out again at a profit but fall outside normal bank regulation, partly by separating themselves legally from the regulated institutions that sponsor them, off their balance sheets.

The shadow banking system is not traditionally described as either an "offshore" or "onshore" phenomenon, but an in-depth 2008 study on SPEs by the Swiss-based Bank for International Settlements is very clear about where the dangerous shadow banks were mainly located.[39] "The most common jurisdictions for US securitisations are the Cayman Islands and the state of Delaware," the BIS said. "The most common SPE jurisdictions for European securitisations are Ireland, Luxembourg, Jersey, and the UK." Every last one is a major secrecy jurisdiction that used a simple business model: ask the financial institutions exactly what they need, then shape the laws accordingly and without democratic debate.

The BIS report calls Cayman "offshore" and Delaware "onshore."[40] It is exactly this misunderstanding—confusing physical geography with political geography—that has led to widespread claims that the secrecy jurisdictions had nothing to do with this gigantic mess. The Bank for International Settlements, along with every other major international financial institution, needs to understand what offshore is and how it works.

Among the only academic experts to have seriously examined offshore's role in the financial crisis is Jim Stewart, senior lecturer in finance at Trinity College, Dublin.

In reports in July 2008 Stewart investigated the Dublin International Financial Services Centre (IFSC), a secrecy jurisdiction set up in 1987 under the corrupt Irish politician Charles Haughey with help primarily from City of London interests.[41] A showcase for high-risk, Wild West financial capitalism, the Dublin IFSC emerged the year after London's giant deregulatory Big Bang and now hosts over half the world's top 50 financial institutions. It became a big player in the shadow banking system and now hosts eight thousand funds with $1.5 trillion in assets. Perhaps most alluring of all Dublin's lures, Stewart said, is its "light touch regulation."[42]

In June 2007 two Bear Stearns hedge funds incorporated in the Cayman Islands announced huge losses, presaging its collapse. Bear Stearns had two investment funds and six debt securities listed on the Irish Stock Exchange and operated three subsidiaries in the Dublin IFSC through a holding company, Bear Stearns Ireland Ltd., for which every dollar of equity financed $119 of gross assets—an exceedingly high and dangerous ratio.

The accounts of Bear Stearns Ireland Ltd. state that it was regulated by the Irish Financial Services Regulatory Authority, and EU directives state that the host country—Ireland, in this case—is responsible for regulation. Yet in an interview, the Irish regulator said he considered his remit to extend to "Irish banks": It was effectively regulated nowhere. The Irish regulator did not feature in any media analysis of Bear Stearns's insolvency; Stewart cited nineteen funds in difficulties in the crisis and added that "almost always, the IFSC link is not discussed."

Several German banks that got into trouble also had funds quoted in Dublin. These included IKB, which got €7.8 billion in German state aid; and Sachsen, which got €17.8 billion of emergency funding and €2.8 billion in state aid. "And yet none of the accounts or prospectus for any of the years examined mentioned regulation or the Irish regulator," Stewart reported. "Within Ireland the Financial Regulator has been quoted as saying that they have no responsibility for entities whose main business is raising and investing in funds based on subprime lending." The Financial Times analysis of the episode laid the blame almost entirely on the structure of the German banking system.

In Ireland, Stewart noted, if the relevant documents are provided to the regulator by 3 P.M., the fund will be authorized the next day. Yet a prospectus for a quoted instrument is a complex legal and financial

document; a debt instrument issued by Sachsen

Bank ran to 245 pages. The regulator could not have assessed it in the two hours between 3 P.M. and the normal close of business. In Luxembourg, Stewart noted, a new law stated that a fund can enjoy preauthorization approval if the fund manager "notifies" the regulator within a month of launch.
It is the captured state, over again.

In April 2010 the U.S. Securities and Exchange Commission (SEC) opened a fraud probe into Goldman Sachs, alleging that it misled investors by misrepresenting the role of a CDO in a deal known as Abacus 2007-AC1. In July 2010 Goldman agreed to pay $550 million to settle the charge without admitting or denying the SEC's allegation. The deal's structure is notable[43]:

> Issuer: ABACUS 2007-AC1, Ltd., Incorporated with limited liability in the Cayman Islands.
> Co-Issuer: ABACUS 2007-AC1, Inc., a corporation organized under the laws of the state of Delaware.

McClatchy's, the only mainstream media organization to investigate the deal's offshore nature, found 148 such deals by Goldman Sachs in the Cayman Islands over a seven-year period.[44] In fact, every big Wall Street player used the Caymans for this business. These deals "became key links in a chain of exotic insurance-like bets called credit-default swaps that worsened the global economic collapse by enabling major financial institutions to take bigger and bigger risks without counting them on their balance sheets . . . sheltered by the Caymans' opaque regulatory apparatus."

It was not so much the Caymans' opacity that attracted these large players—though that helped—as its "flexibility." When tax haven supporters say they promote "efficiency" in global markets, this is the kind of thing they are talking about. At the heart of this efficiency is these jurisdictions' flexibility, which, as we have seen, is really about their political capture by financial capital. Whatever the banks want, they get. And from this flows power.

Rudolf Elmer, a senior accountant in a Swiss bank's Caymans office until 2003, takes the story further.[45]

Supervision in the Caymans was especially lax, he said. "Even if you have the right regulatory framework," he said, "you need the brainpower to audit the banks and companies. There is a general lack of this in the offshore world. You get a lot of high-risk issues running through the islands, being covered by junior auditors in CIMA [the Cayman Islands Monetary Authority]."

One of his office's functions was to take out cheap short-term loans and invest the proceeds in longer-term assets with higher rates of return. This is an easy way to make tax-free money—but it is dangerous too: You must "roll over" short-term loans every few days, replacing one loan with another. This is easy in the good times, but when lending dries up, as it did in 2007, you must still repay the short-term loans fast—but suddenly nobody will provide new loans to replace them. You can fall into default very quickly. This is exactly what brought down the British bank Northern Rock in 2007. Yet the Caymans regulator, Elmer said, took an extremist laissez-faire approach to these so-called maturity mismatches. "This is a short-term and long- term problem," said Elmer. "From a regulatory point of view we couldn't have done that in the UK or Switzerland. The Cayman Islands Monetary Authority (CIMA) should have picked that up."

Elmer was involved in two CIMA audits. In the first one, he and his local CEO talked for an hour or so with a CIMA official. "The CIMA person said, 'Is it the same as it used to be?' The CEO said, 'Yes, it is the same.' The CIMA guy said, 'No problem.' The Cayman regulator knew our CEO well, and he knew he would tell him the truth. Personal relationships were key." A subsequent, later audit was more extensive and lasted about a week. "You have to be very experienced in that sort of thing," said Elmer. "Two junior auditors came in and made a lengthy report, which had little content. I went through those audits, and from a regulatory point of view, they were not sufficient at all." No further action was taken.

"It was quite crucial for [our] group to use Cayman and BVI vehicles," he said. "It boils down to three things: tax, regulatory, and legal advantages. You have a lot of freedom."

This extreme freedom, turning the secrecy jurisdictions into hothouses for risky new banking products, contributed massively to the crisis of the world's major economies.

The rise of debt in our economies has yet more offshore fathers. There is only space here briefly to sketch a few important ones.

In 2009 the IMF published a detailed report explaining how tax havens, combined with distortions in onshore tax systems, cranked up the global debt engine by encouraging firms to borrow rather than finance themselves out of equity.[46] These effects, it said, "are pervasive, often large—and hard to justify given the potential impact on financial stability." Amid all the noise from G20 leaders about tax havens in 2008 and 2009, the IMF concluded, this dangerous offshore aspect went entirely unnoticed.

The core principles the IMF outlined are simple. A corporation borrows money from offshore, then pays interest on that loan back to the offshore financing company. It then uses the old transfer pricing trick: the profits are offshore, where they avoid tax, and the costs (the interest payments) are onshore, where they are deducted against tax.

This simple trick is central to the business model of private equity companies. They will buy a company that someone has sweated for years to create, then load it up with debt, cutting the tax bill and magnifying the returns.

Leveraged buyouts—always involving offshore leverage—accelerated fast ahead of the crisis: The amount raised by private equity funds rose more than sixfold from 2003 to over $300 billion in 2007, by which time their share of all U.S. merger and acquisition activity had risen to 30 percent.[47] Reports praise private equity companies for excellent "value creation." Sometimes private equity companies do create real value. But this core feature of their business model is not value creation but value skimming. A big tax bill is slashed, the company's shares or value rise, managers' remunerations become engorged, and wealth is shifted away from taxpayers to wealthy managers and stockholders. Nowhere in any of this did anyone produce a better or cheaper widget. And in the process, extra debt is injected into the financial system. Plenty of good firms have gone bust as a result of this offshore debt-loading, which the New York Times in 2009 described as "a Wall Street version of 'Flip This House.'"[48] More than half of the companies that defaulted on their debt that year were either previously or currently owned by private equity firms.

A lot of innovation that corporations do—I'm talking about useful innovations to make better and cheaper goods and services, not the

financial innovations that simply shift wealth upward and risks downward along the social scale—happen in small and medium enterprises. But the offshore system works directly against this.

First, it subsidizes multinationals by helping them cut their taxes and grow faster, making it harder for the innovative minnows to compete. And when small innovative firms do emerge they becomes targets for predators who seek to "unlock value" from "synergies" created by bringing the small firm into the bigger, more diversified one. Some synergies may be useful— economies of scale, for instance—but too often the predator can "unlock value" simply by being better at squeezing out these abusive, unproductive offshore tax privileges. Some make their best profits by seeking out and harvesting those small, genuinely innovative companies that haven't yet been abusive enough on offshore tax avoidance to "unlock" those abuses for themselves.

This harvesting then removes nimble, competitive, and innovative firms from the marketplace and relocates them inside large corporate bureaucracies, curbing competition and potentially raising prices. Debt rises, and ordinary people pay more tax, or see their schools and hospitals fall into disrepair. And if the predators leave their earnings offshore they can "defer" tax on them indefinitely. Deferred taxation is, as the accountant Richard Murphy puts it, "an interest-free loan from the government, with no repayment date." In other words, more debt.

Consider what happens when this multinational corporation is a bank. Like multinationals on steroids, banks have been particularly adept at going offshore to grow fast: by using it to escape tax, to dodge reserves requirements and other financial regulation, and to gear up their borrowings.

Banks achieved a staggering 16 percent annual return on equity between 1986 and 2006, according to Bank of England data,[49] and this offshore-enhanced growth means the banks are now big enough to hold us all ransom. Unless taxpayers give them what they want, financial calamity ensues. This is the "too big to fail" problem—courtesy of offshore.

But even that is still not all.

This one takes a little bit of explanation. Many blame the latest crisis not just on deregulation but also on global macroeconomic imbalances, as funds have flowed from countries with export surpluses, like China, India, Russia, and Saudi Arabia, and into deficit countries like the United States and Britain. This has led to overconsumption and borrowing in the deficit countries.

Now look at Global Financial Integrity's estimate that illicit financial flows

out of developing countries has been running at up to a trillion dollars each year. Most has flowed out of large developing countries like China and Russia and Saudi Arabia and into large OECD countries like Britain and the United States. Illicit flows in the other direction are much smaller, so the net result is a flow worth hundreds of billions of dollars each year into rich economies and secrecy jurisdictions.[50] The illicit flows, which are unrecorded and hardly noticed, add to those recorded imbalances.

Let's look quickly at what happens on the ground. Imagine a Mexican company orders construction equipment from the United States and agrees to a price of $10 million. But the Mexican company asks for the commercial invoice to be drawn to read $12 million. The buyer does this because when he pays his $12 million, $2 million of that is secretly deposited into his Miami bank account. The missing $2 million is invisible to the numbers crunchers who compile the trade statistics—though it represents a very real illicit financial flow from Mexico to the United States—and it has tangible effects: It will push up U.S. house prices, distort the U.S. housing market, and boosts bank profits from their mortgage operations. First-time buyers find it harder to get on the property ladder, a housing bubble inflates further, and debt builds up in the economy.

As if all this were not enough, there is yet more.

Trust is a central ingredient in any economy. Where participants in a market don't trust each other, expensive litigation substitutes for honest behavior. And there is nothing— nothing—like the offshore system to generate opacity and erode trust and the behavioral constraint. When nobody can find out what a company's true financial position is until after the money has evaporated, trickery and bamboozlement abound. Financial markets seized up in 2007 because nobody knew, or trusted, what the other players in the market were doing, or what they were worth, or what or where their risks were. It is no coincidence that so many of those involved in great financial trickery, like Enron, or the empire of the fraudster Bernie Madoff, or Sir Allen Stanford's Stanford Bank, or Long Term Capital Management, or Lehman Brothers, or AIG, were so thoroughly entrenched offshore.

The secrecy jurisdictions specialize in bamboozlement. Along with the secrecy, and a curmudgeonly reluctance to co- operate with foreign jurisdictions, the offshore system provides endless incentives for corporations—especially financial ones
—to festoon their affairs across jurisdictions, usually a complex mix of

onshore and offshore, to fox the regulators. These giant impenetrable offshore trails, sliced, diced, and trailed around the world, increased the distance between the lenders and their borrowers until bankers no longer knew who their ultimate clients were. It is hardly a surprise that the Royal Bank of Scotland in 2003 offered a gold credit card with a ten-thousand-pound spending limit to a Monty Slater in Manchester, England. Monty Slater was a Shih Tzu dog.[51]

John Maynard Keynes summed up the problem well. "Remoteness between ownership and operation is an evil in the relations among men, likely or certain in the long run to set up strains and enmities which will bring to nought the financial calculation."

With this observation, Keynes exposed the flaw in the grand bargain at the heart of the globalization project. In giving freedom to finance, people in democratic nation-states lost their freedom to choose and implement the laws and rules that they wanted. But they handed these freedoms to the world's financiers in exchange for a promise: that the efficiency gains from those free financial flows will be so great as to make that loss of freedom worthwhile.

The tax havens helped bring this calculation to naught.

CONCLUSION
Reclaiming Our Culture

JOHN MAYNARD KEYNES'S OBSERVATION IN THE AFTERMATH of the Wall Street Crash, which I cited in chapter 3, is as apt today as it was when first articulated: "We have involved ourselves in a colossal muddle, having blundered in the control of a delicate machine, the working of which we do not understand." But the financial system is vastly more dangerous and pervasive now. Changes to domestic banking regulations matter but will never suffice. Reform must be based on a thorough grasp of the new, globalized reality—and anyone who wants to understand the modern financial machine must understand what tax havens are and how they work.

We must tackle the offshore system. I will point to ten major areas for change, in no particular order and as briefly as I can. All overlap with each other—and the last ties them all together.

First, we can pursue transparency. Many and varied changes are needed; here are two.

About 60 percent of world trade happens inside multinational corporations, which cut taxes by shuffling money between jurisdictions to create artificial paper trails that shift their profits into zero-tax havens and their costs into high-tax countries. The complexity and cost of this system cause great harm.

But these maneuverings are invisible in corporations' annual reports. Under current accounting rules corporations can scoop up all their results—profits, borrowings, tax payments, and so on—from several countries and consolidate each into one figure, perhaps broken down by region. So a corporation may publish its profits from, say, Africa, but nobody can unpick those numbers to work out the profits in each country. You can't find the information anywhere. Trillions of dollars' worth of cross- border flows simply disappear from view. So a citizen in a country where a multinational operates cannot tell from these reports even whether that corporation operates there, let alone what it does, its level of activity, its profits, its local employment, or its tax payments. As multinationals become ever more complex, this problem just gets worse.

One might think that the main global rule-setter for international accounting standards would be a public international body accountable

to democratic governments. It is not. The International Accounting Standards Board (IASB) is a private company financed by the Big Four accountancy firms and global multinationals, headquartered in the City of London, and registered in Delaware.[1]

Richard Murphy, an accountant arguing for reform of international accounting standards, summarizes the problem as it stands. "A company gets its license to operate in any territory from the government that represents those people. It has a corporate duty to account in return. This is the essence of stewardship and accountability. Instead we have companies pretending they float above all these countries. They don't."

If multinationals had to break their financial information down by country and disclose what they do in each place, global markets would immediately become more transparent. A secret trove of information vital to citizens, investors, economists, and governments would come onshore and into view. Country-by-country reporting, as it is known, is already making progress in policymaking circles, particularly for the extractive industries.[2] It now needs major support and must be expanded to include all businesses—especially the banks.

Another essential step concerns how governments share information about the local incomes and assets of each others' citizens. If a person in one country owns an income-generating asset in another country, his or her tax authorities need to know about it. So governments need to share relevant information, subject to appropriate safeguards.

But the dominant standard for exchanging information is the OECD's "on request" standard: a cheats' charter whereby a country already has to know what it is looking for before it requests the information from another on a bilateral basis. Developing countries are particularly vulnerable here. The OECD's standard can be replaced by the far better alternative: automatic information exchange on a multilateral basis, where countries automatically tell each other what their respective taxpayers own and earn. Such a system exists in Europe: It works well and does not leak information (though major loopholes need plugging to defend against the Caymans trusts, Nevada corporations, Liechtenstein foundations, Austrian hidden Treuhands, and various other secrecy facilities that infest the offshore system). Momentum is just starting to build for change here[3]—and this can now be rolled out worldwide and vigorously supported. Sanctions and blacklists can spur the shift.

As a second major area for reform, we can prioritize the needs of developing countries.

The pattern always seems to be the same. A secrecy jurisdiction comes up with a new abusive offshore structure, and wealthy countries construct defenses against it as best they can. But poor countries, without the relevant expertise, are left wide open to the new drain. In February 2010 Misereor, a German development organization, researched the new information exchange agreements that had been signed between countries after world leaders promised to crack down on tax havens at a G20 meeting in Washington in 2008. Misereor found that just 6 percent of the tax treaties, and zero percent of the tax information exchange agreements, were signed with low- income countries. "While G20 and OECD are promoting DTTs and TIEAs as centre-pieces of a global standard on transparency and cooperation," Misereor concluded, "statistics show that poor developing countries are simply left out."[4]

Tax is the Cinderella in the debates about financing for development. Overshadowed for decades by its domineering sisters—aid and debt relief—tax is now, at last, starting to emerge from the shadows. Tax is the most sustainable, the most important, and the most beneficial form of finance for development. It makes rulers accountable to their citizens, not to donors, and the right kinds of taxes stimulate governments to create the strong institutions they need for getting their citizens and corporations to pay tax.

Three things can now happen. First, developing and middle-income countries can find a voice to articulate their concerns about this global system for transferring wealth from poor to rich and work together. A few countries like Brazil and India are beginning to construct serious offshore defenses, and the time is ripe for this to become a mass movement. Second, official development assistance in this area can rise dramatically: Less than one-thousandth of development aid is currently spent on helping countries improve their tax systems[5]—and much of that is spent on ideas that may make poverty worse, not better.

Third, if citizens and civil society organizations were to stop focusing so exclusively on aid, in order to help revitalize the debates about tax and its role in fostering accountability, things can change. Aid can help—but with ten dollars being drained out of the developing world for every dollar going in, we need new approaches. If there were ever a movement that could unite the citizens of developing and wealthy countries in one cause, this is it.

The third big change to make is to confront the British spiderweb, the most important and most aggressive single element in the global offshore system.

The City of London Corporation—the offshore island floating partly free from Britain's people and its democratic system— must be abolished and submerged into a unified and fully democratic London. The City's international offshore spider-web, the mechanism for harvesting and profiting from financial capital from around the globe, however dirty it may be, must be dismantled. It harms the people of Britain, and it harms the world at large. Britain is too thoroughly captured by the City and its offshore sector to do this alone: Pressure from outside is essential. Developing countries in particular need to appreciate how offshore is a somewhat imperial economic system, in which their own elites are deeply implicated. Alongside this new focus we need a greater understanding of the role of the United States as an offshore jurisdiction in its own right and the harm this causes, inside and outside the United States.

Onshore tax reform presents another arena where changes can be made. Endless possibilities exist, and I will focus on just two big, promising solutions that have been almost entirely overlooked.

The first is land value taxation.[6] This needs a very brief detour. A street musician who sets up his stall in the middle of the main street will earn far more than if he plays on the outskirts of town. The additional earnings on the best sites, over and above what he would earn on a just-worthwhile site, owe nothing at all to his skill or efforts[7]—they are pure, unearned "rental value." If a government builds a major new railway line, property owners near the new stations will see their properties rise in

value through no efforts of their own. It is pure windfall: unearned rental value. The correct approach to unearned natural rents like these is to tax them at high rates (and use the proceeds to either cut taxes elsewhere or spend more). This is not a tax on property ownership, but a tax on land: whether or not that piece of prime real estate is owned by a Russian oligarch hidden behind a Liechtenstein anstalt, the bricks of the building sited there are rooted firmly into the soil, and the tax can be levied. Because land cannot move, this tax is insulated against offshore escape. It encourages and rewards the best use of land and keeps rents lower than they would otherwise be.

Not only that, but a huge share of the profits of the financial sector derive ultimately from real estate business and land value. Tax land's rental value, and you capture a big slice of this financial business, however much it is reengineered offshore. When Pittsburgh became one of the few places in the world to adopt the tax in 1911, in the teeth of massive resistance from wealthy landowners, it had dramatic and positive effects: While the rest of America went on an orgy of land speculation ahead of the Crash of 1929, prices in Pittsburgh only rose 20 percent. Harrisburg's adoption of the tax in 1975 led to a dramatic inner-city regeneration. The tax is simple to administer and progressive (that is, the poor pay less)—and can be especially useful for promoting growth in developing countries.

Another promising, much-overlooked scheme concerns mineral-rich countries. Tides of looted or tainted oil money sluice constantly into the offshore system, distorting the global economy in the process. A radical and controversial proposal would upend this phenomenon by distributing a large share of a country's mineral windfalls directly, and without discrimination, to every inhabitant. This has only been implemented in a few places like Alaska, but in many other mineral-rich countries, even poor ones, it is feasible. Doing so could prevent hundreds of billions of dollars of stolen mineral-sourced loot from draining to offshore centers and deliver tremendous benefits for the populations concerned.

A corollary of onshore tax reform is leadership and unilateral action.

After the September 11, 2001, attacks, U.S. legislators tried to insert stronger anti-money-laundering provisions into the PATRIOT Act. In the halls of Congress, civility collapsed, and shouting matches erupted

between bank officials and congressional staffers.[8] Among other things, the bankers were defending offshore shell banks, which hide behind nominees and trustees so no one can know who their real owners and managers are. Senator Carl Levin who led the charge—after having had eleven transparency bills shot down by Senator Phil Gramm—stuck to his guns, and in the post-9/11 environment he at last got his way: remarkable provisions saying that no U.S. bank may receive a transfer from a foreign shell bank, and no foreign bank may transfer money to the United States that it has received from a foreign shell bank. The result, as Raymond Baker explains, is that "the thousands of shell banks that used to run loose have been reduced to perhaps a few dozen…. With a stroke of the legislative pen, a major threat to economic integrity has been almost completely removed from the global financial system." International agreement is generally a good thing, in cases like this. But leadership can work wonders too.

Too often, when corporations or individuals threaten to relocate offshore if they are taxed or regulated too highly, or asked to be too transparent, or to submit to criminal laws, government officials quail and give the wealthy owners of capital what they want. Not only that, but efforts to stop people from using abusive offshore loopholes are also greeted with the same cries of "Don't crack down on that loophole or we will go elsewhere!"

The latest crisis has made clear that much financial services activity is actually harmful. So if certain parts of the financial industry leave town—so much the better. Good projects will always find financing, whether or not your country is stuffed with foreign financiers, and local bankers are better placed to supply it because they know their customers. Tax and regulate the financial industries according to an economy's real needs, ignore the screams that capital and bankers will flit offshore, and you will tend to drive out the harmful parts, leaving the useful bits behind. The key is leadership. Unilateral action can work.

Another major task is to tackle the intermediaries and the private users of offshore.

Rudolf Strahm, a Swiss parliamentarian, studied every historical episode where Swiss bank secrecy has been loosened in response to foreign pressure and concluded that pressure only works when applied to Swiss banks. Every attempt to pressure the Swiss government was seen

as an attack on national pride—and failed.

When a kleptocrat loots his country and shifts the looted wealth offshore, the banks, accountants, and law firms that assist him are just as guilty as the kleptocrat. When a client gets caught and goes to jail, so should his or her relationship manager, accountant, trustee, lawyer, and corporate nominee. A few organizations like London-based Global Witness have sought to call these intermediaries to account—but we now need a sea change in the world's approach. Get serious with these people at last.

As regards the end users of offshore services, many strategies are needed. I will mention just one. Its awful-sounding name—Combined Reporting with Formula Apportionment and Unitary Taxation—masks a simple, powerful, and straightforward approach to tax, which California already uses successfully to confront transfer pricing abuses.

Instead of the current approach of trying to tax each separate bit of a multinational as if it were a free-floating entity, tax authorities could treat the multinational group as a single unit, then "apportion" its taxable income out to the different jurisdictions where it operates, under an agreed formula based on real things like sales, payrolls, and assets in each place. Each jurisdiction can tax its portion at whatever rate it wants. So consider a U.S. multinational with a one-man booking office in Bermuda, with no local sales. Current rules let it shift billions of dollars in profits there to skip tax. But under the alternative system based on sales and payroll, the formula would allocate only a minuscule portion of the income to Bermuda—so only a minuscule portion of its overall income would be subject to Bermuda's zero tax rate. The rest would get taxed properly based on the substance of what it does in the real world, rather than on the gymnastic legal form its accountants have created for it. Several U.S. states already use it quite successfully. Countries can do this unilaterally—and if this happened widely a vast part of the tax havens' business model would disappear. Again, developing countries could be particularly helped by this.

In this context, the financial sector needs special mention as a vast area to reform. Severe pundit fatigue has already set in on this topic, so I will just make two short recommendations that have not been a part of the general clamor.

First, policymakers, journalists, and many others can start to

understand and accept how tax havens have become the fortified refuges of financial capital, protecting it from tax and regulation and in the process contributing to the latest crisis in many and varied ways. The veil of silence and ignorance can be lifted and the message spread.

Second, countries worried about the safety of their financial systems could compile blacklists of financial regulatory havens based on the Jersey-Delaware notion of the captured state: a place that seeks to attract money by offering politically stable facilities to help people or entities get around the rules, laws, and regulations of jurisdictions elsewhere. This blacklisting will be easy enough, technically speaking, once we understand what we are looking for. With these blacklists, appropriate prohibitions and regulations—many of them very simple—can be put in place to help countries reclaim their sovereignty and respect voters' wishes once more. Along with this another benefit would flow: Once these berserkers in the international regulatory system are out of the picture, international cooperation on financial reform will become much easier. This proposal will also help us guard not only against repeating the errors that led to the latest crisis but also against those of the next one, whose causes we may not even be able to imagine yet.

Next, we should rethink corporate responsibility.

Societies grant corporations immense privileges, such as limited liability, which lets investors cap their losses and shift outstanding debts onto the rest of society when all goes wrong. They have also been granted the right to be treated as artificial legal entities that can relocate to different jurisdictions almost at will, irrespective of where they really do business. In exchange for these remarkable privileges, corporations were originally held to a set of obligations to the societies in which they are embedded: notably to be transparent about their affairs and to pay tax.

The offshore system has undermined all this. The privileges have been preserved and enhanced, but the obligations have withered. Tax must now be brought squarely into corporate responsibility debates. Corporate managers are taught to think that they are accountable only to shareholders. From this perspective, escaping tax seems to be their duty. But we have forgotten the fundamental truth that corporations get

their license to operate, and the tools and confidence to do so effectively, from society. Seen this way, tax is not a cost to shareholders, to be minimized, but a distribution to the stakeholders in the enterprise: a return on the investment societies and their governments make in infrastructure, education, law and order, and the other basic prerequisites for all corporate activity. The shareholders must get their due, but the societies they depend on must too. When we start to make corporations feel they are accountable not only to shareholders but to societies too, a whole new arena will have been created in which the offshore system can be questioned and challenged.

We can also reevaluate corruption. I have already indicated how predominant corruption rankings of countries rate many of the world's top tax havens—the repositories of trillions of dollars of corrupt, stolen loot—as the world's "cleanest" jurisdictions, and how a new Financial Secrecy Index, which I mentioned in chapter6, has started the process of setting the record straight.

But we can move beyond rearranging the geography of corruption and reassess what corruption is. At heart, corruption involves insiders abusing the common good, in secrecy and with impunity, undermining the rules and systems that promote the public interest, and undermining our faith in those rules and systems. In the process it worsens poverty and inequality and entrenches vested interests and unaccountable power.

Bribery does all these things. But many of the services tax havens provide also do these things. This close analogy between bribe-paying and the business of secret offshore escape is no coincidence: We are talking about similar underlying processes. Some people have praised bribery as a way of getting around bureaucratic obstacles: Without that bribe, that company won't get its container through the port. They are wrong, of course: Bribery may benefit the bribe-payer, but it damages the system as a whole. Similarly, the defenders of secrecy jurisdictions argue that their services help private actors get around "inefficiencies" in mainstream economies, smoothing the way for business to proceed. And they do. But what are those "inefficiencies"? They are, most importantly, tax, financial regulations, criminal laws, and transparency—all of which are there for good reason. To help someone get around the obstacle is to corrode the system and trust in the system. Bribery rots and corrupts governments, and tax havens rot and corrupt the global financial system.

Once we start seeing this we will no longer limit ourselves to pointing fingers at developing country kleptocrats and rogue officials but will begin to examine a much broader array of actors and their facilitating activities. And we will have found a rubric for the citizens of rich and poor countries to find common cause in fighting a global scourge.[9]

The final and most important thing is to change the culture. When pundits, journalists, and politicians fawn over people who get rich by abusing the system—getting around tax and regulation and forcing everyone else to shoulder the associated risks and taxes—then we have lost our way.

Language can change. When someone claims that tax havens make global finance more efficient, we can ask, "Efficient for whom?" When someone says countries should compete with each other on tax or financial regulation, or that policymakers should aim for a more competitive tax or regulatory system—one may ask: "What kind of competition are you talking about? A race to the bottom on tax, secrecy, or financial regulation? Or a race to the top, such as when corporations operate in competitive markets on a level playing field?" When we hear "privacy" or "asset protection" or "tax efficient" in the context of private banking, companies can be asked exactly what they mean. When a private equity company shows record profits, we can be told how much of that comes from genuine productive improvement, and how much comes from gaming the offshore system. When hearing a pillar of society say that they are a well-regulated, cooperative, and transparent jurisdiction, the investigator can assume the opposite and probe further. When magazines carry alluring advertisements from seedy offshore promoters who may be inciting clients to criminal behavior, we can complain. When corporations talk about social responsibility, we can ask if they mean tax. When journalists need expert commentators to advise them about that tax story they are writing, they must understand that their interviewee from the big accountancy firm works for a business that makes a living out of helping wealthy corporations and individuals get around paying tax, and that their opinions will reflect that corrupted worldview. They must find alternative opinions to balance those views.

The world's international institutions and responsible governments could create and promote new guidelines and codes of conduct outlining responsible and irresponsible behavior in the fields of international tax and regulation, with special focus on offshore abuse. They could introduce general antiavoidance principles into their tax laws so that complex and abusive trickery, while technically not breaking the details

of legislation, can be disallowed. Tax evasion can become a predicate crime for money laundering, and tax offenses, among others, could be included in international conventions such as the United Nations Convention Against Corruption. Professional associations of lawyers, accountants, and bankers could create codes of conduct stressing, among other things, that it is unacceptable for a member to help a client commit a financial crime, whether the crime occurs at home or overseas. The economics profession needs to reappraise its approach to understand the effects of things such as secrecy and regulatory arbitrage. It could start to measure illicit, secret things, difficult though that may be.

We can recapture our culture from the forces of unaccountable privilege that have taken it away from us.

At the time of writing, heavy government spending around the world has staved off outright economic collapse following the meltdown in global finance, but at huge costs to taxpayers. “Never in the field of financial endeavor has so much money been owed by so few to so many,” said Mervyn King, the governor of the Bank of England. “And, one might add, so far with little real reform.”

It is time for the great global debate about tax havens to begin in earnest. Whoever you are, wherever you live, and whatever you do, offshore is at work nearby. It affects you. It is undermining the government you elect, hollowing out its tax base and corrupting your elected politicians. It is sustaining a vast criminal economy and creating a new, unaccountable aristocracy of corporate and financial power. If we do not act together to contain, control, and eradicate financial secrecy, then the world I found in West Africa more than a decade ago, a world of suave insiders, criminal complicity, and desperate poverty, will become the world we leave to our children. A tiny few will have their boots washed in champagne, while the rest of us struggle to make our lives in conditions of steepening inequality. We must avert this future.

CHAPTER 1
WELCOME TO NOWHERE

1. These figures should be taken as very rough estimates, not least because

there is no agreement as to what a tax haven is, and estimates can vary widely.

Once we understand that the United States and United Kingdom are major tax havens, the eye-catch figure is quite reasonable, if vague. This particular statistic is from French finance minister Dominique Strauss-Kahn in a speech to the Paris Group of Experts in March 1999; quoted in J. Christensen and M. Hampton, "All Good Things Come to an End," The World Today (Royal Institute of International Affairs) 55, nos. 8–9 (1999). The share has grown substantially since then, because offshore financial services have been growing at substantially faster rates than the growth in trade.

2. See Ronen Palan, Richard Murphy, and Christian Chavagneux, Tax Havens: How Globalization Really Works (Ithaca, NY: Cornell University Press, 2010), p. 51. This work uses BIS data to show offshore's share of banking assets and liabilities rising to around 65 percent in 1990, before falling to 51 percent in 2007. Other measures of offshore, in various tables in the book, show explosive recent growth (interrupted by the financial crisis). Also see Luca Errico and Alberto Musalem, "Offshore Banking: An Analysis of Micro- and Macro-Prudential Issues," IMF, January 1999, pp. 17–19. This study cites a figure of 54 percent in 1999, which is based on a relatively restrictive definition of offshore; subsequent measurements are affected, according to the IMF, because "the distinction between onshore and offshore banking has become progressively blurred."

3. Data from Palan et al., Tax Havens; from "IMF Finds 'Trillions' in Undeclared Wealth," Wealth Bulletin, March 15, 2010; and from M. K. Lewis, "International Banking and Offshore Finance: London and the Major Centres," in Mark P. Hampton and Jason P. Abbott, eds., Offshore Finance Centres and Tax Havens: The Rise of Global Capital (London: Macmillan Business, 1999).

4. The U.S. Government Accountability Office (GAO) reported in 2008 that 83 of the nation's hundred biggest corporations had subsidiaries in tax havens; the following year the Tax Justice Network, an advocacy organization that criticizes tax havens, used a broader definition of a tax

haven and found that 99 of Europe's 100 largest companies used offshore subsidiaries.

5. This loose definition is the result of collegiate discussions among members of the Tax Justice Network and other contacts primarily in the United States. It is similar to a definition offered by Richard Murphy, of the tax consultancy and advocacy company Tax Research UK, who defines secrecy jurisdictions as "places that intentionally create regulation for the primary benefit and use of those not resident in their geographical domain. That regulation is designed to undermine the legislation or regulation of another jurisdiction. To facilitate its use secrecy jurisdictions also create a deliberate, legally backed veil of secrecy that ensures that those from outside the jurisdiction making use of its regulation cannot be identified to be doing so."

6. See "The Cayman Islands as an Offshore Tax Haven," http://www.cayman-information.com/cayman-islands_offshore_tax_haven.php.

7. See Jesse Drucker, "Google 2.4 percent Rate Shows How $60 Billion Lost to Tax Loopholes," Bloomberg, October 21, 2010.

8. See Martin A. Sullivan, "Microsoft Moving Profits, Not Jobs, Out of the U.S.," Tax Notes, October 18, 2010; and Martin A. Sullivan, "Cisco CEO Seeks Relief for Profits Shifted Overseas," Tax Analysts, November 29, 2010.

9. John W. Diamond, "International Tax Avoidance and Evasion," National Tax Journal, December 1, 2009.

10. Form 10-Q for Chiquita Brands International Inc., Quarterly Report, May 5, 2009, http://biz.yahoo.com/e/090505/cqb10-q.html.

11. See Senator Carl Levin news release, "Dorgan and Levin Release Study Showing Majority of Corporations Pay No Federal Income Tax," August 12, 2008.

12. The problem is getting worse—it is estimated that by 2007 the United States was losing an additional $28 billion in annual revenue, over and above what it was already losing before 1999, due to the worsening offshore shenanigans by nonfinancial U.S. corporations. If you include financial corporations, the sum is far bigger. See Testimony of Martin A. Sullivan, contributing editor, Tax Analysts , Before the Committee on Ways and Means U.S. House of Representatives, July 22, 2010. As Sullivan reported, in 2007 a quarter of all foreign profits of U.S.-based multinationals outside the financial sector were realized in just five tax havens: Bermuda, Singapore, Ireland, Switzerland, and the Cayman Islands.

13. Media reports have claimed that Switzerland's banking secrecy laws were the product of efforts to protect German Jews from the Nazis. This story originated from a November 1966 bulletin from the Schweizerische Kreditanstalt (today's Credit Suisse), and it is false. See Bruno Gurtner, "Swiss Secrecy Had Nothing to Do with the Nazis," Financial Times letters, March 26, 2009; and Sebastién Guex, "The Origins of the Swiss Banking Secrecy Law and Its Repercussions for Swiss Federal Policy," Business History Review 74 (summer 2000): 237–266, http://www.jstor.org/pss/3116693. Note also that tiny Liechtenstein next door emerged as a kind of Swiss appendage after the First World War.

14. Luxembourg specializes in holding companies exempt from income taxes, introduced in 1929.

15. IMF data records Luxembourg's investment liabilities at $2.5 trillion and its assets at only $1.5 trillion, a discrepancy of a trillion dollars. And these are just portfolio investments: add cash deposits, and the sums are bigger still. See "IMF Finds 'Trillions' in Undeclared Wealth," Wealth Bulletin, March 15, 2010.

16. "Kim Jong-il Keeps $4bn 'Emergency Fund' in European Banks," Daily Telegraph, March 14, 2010.

17. See, for example, Akin Gump Strauss Hauer & Feld LLP news release, "Halliburton Co., KBR, Inc. and KBR LLC Agree to Largest Combined Settlement of FCPA Charges by U.S. Companies," February 13, 2009. Halliburton and KBR settled with the Department of Justice for $579 million in 2009.

18. It is no coincidence that London, the former capital of the greatest empire the world has known, is also the center of the most important part of the global offshore system. Until the early 1990s, economic historians had viewed the British empire in large part as a corollary of the industrial revolution, which had made the empire both necessary and possible; empire was, to a large degree, a story about industrial capitalism and trade. But in 1993 the economic historians P. J. Cain and A. G. Hopkins transformed this view with a two-volume book, British Imperialism: Innovation and Expansion 1688–1914 (London: Longman, 1993) and British Imperialism, Crisis and Deconstruction 1914–1990 (London: Longman, 1993), which recast the empire as something that was most fundamentally a story about financial capital, international credit, and the City of London, the governor of the imperial engine. This imperial connection, which will become clear as the book progresses, is of paramount importance to any understanding of the offshore system and of the City of London, the governor of a large part of the offshore engine.

19. Martin A. Sullivan, “Offshore Explorations: Jersey,” Tax Notes, October 23, 2007; “Offshore Explorations: Isle of Man,” Tax Notes, November 5, 2007; “Offshore Explorations: Guernsey,” Tax Notes, October 10, 2007. These are considered conservative estimates: Offshore bank deposits in Jersey alone were worth $800 billion in mid-2009; Colin Powell, chairman of the Jersey Financial Services Commission, estimated in 2009 that trusts in Jersey alone might involve another $300 to 400 billion.

20. Seven, including the Falkland Islands and the British Antarctic Territory, are not havens. Ascension Island, which houses highly secretive U.S. and British military bases, serves a quasi-imperial purpose as a base to help project British power overseas.

21. For example, 2003 saw the collapse of major money-laundering trials in which a key witness was forced to admit that he had been serving as an MI6 agent.

22. The Cayman Islands reported to the IMF $750 billion in portfolio assets (that is, loans, securities, and other profitable things) in 2008. This quantity of assets ought to be matched, more or less, by similarly sized liabilities (deposits and other obligations) on the other side of the balance sheet—yet these added up

to $2.2 trillion for the Cayman Islands, three times as much as the assets. See David Bain, "IMF Finds 'Trillions' in Undeclared Wealth," Wealth Bulletin, March 15, 2010. The IMF report is Philip R. Lane and Gian Maria Milesi-Ferretti, "Cross-Border Investment in Small International Financial Centers," IMF Working Paper 10/38, February 2010.

23. See Palan et al., Tax Havens, p. 11. The authors estimate that the Crown Dependencies and Overseas Territories, plus the former empire, account for 37 percent of all banking liabilities and 35 percent of all banking assets; the City of London accounts for 11 percent. Even back in 1996, the U.S. lawyer John Moscow estimated that apart from Switzerland and Liechtenstein, nearly every offshore dirty-money center was British run or controlled. See Chris Blackhurst and Clare Garner, "A Trillion Dollars in Dirty Money Keeps Island Tax Havens Afloat," The Independent, September 11, 1996.

24. The term "British Spiderweb" was coined, I believe, by Jim Henry, author of Blood Bankers.

25. See, for example, "Britain Imposes Direct Rule on Turks and Caicos," Associated Press, August 14, 2009. Plans are now afoot to prepare new elections for

20

11

.

26. Although Ireland lies in the Eurozone, its emergence as a secrecy jurisdiction in the late 1980s was substantially linked to interests in the City of London, and its Wild West spirit of laissez-faire financial market regulation—the turning of a blind eye to nefarious activities and potential risks—was inspired by British, not continental European, models. It is also part of a British sphere of influence.

27. "Users of 'Tax Havens' Abroad Batten Down for Political Gale," New York Times, February 26, 1961.

28. Next came Bank of America, Lehman Brothers, and Wachovia Corp., with 115, 59, and 57 tax haven subsidiaries, respectively. See "Large U.S. Corporations and Federal Contractors with Subsidiaries in Jurisdictions Listed as Tax Havens or Financial Privacy Jurisdictions," U.S. Government Accountability Office, December 2008.

29. A conference in the City of London in 1995 was told that the industry objective was to shift offshore the majority of financial assets owned by the world's high- net-worth individuals by the end of the decade. See Steven Hiatt, ed., A Game as Old as Empire: The Secret World of Economic Hit Men and the Web of Global Corruption (San Francisco: Berrett Koehler,

2007), p. 55.

30. See Senator Levin, news release, "Senate, House Members Introduce Stop Tax Haven Abuse Act: Bill Targets $100 Billion in Lost Tax Each Year from Offshore Tax Dodges," March 2, 2009. This $100 billion has several components and is in the middle of a range of estimates: The U.S. Treasury in 2007 cited estimates ranging between $40 and $123 billion annually. See Treasury Inspector General for Tax Administration, Office of Inspections and Evaluations, "A Combination of Legislative Actions and Increased IRS Capability and Capacity Are Required to Reduce the Multi-Billion Dollar U.S. International Tax Gap," January 27, 2009.

Levin also states that "abusive domestic tax shelters cost tens of billions of dollars more." The United States has unusually sophisticated systems in place to stem offshore leakage; developing countries suffer far more in relation to the size of their economies. Education budget details from Office of Management and Budget, www.whitehouse.gov.

31. From the 2008 GAO report. Anumber of companies, including Delphi, Dow Chemical, MetLife, Pfizer, and Washington Mutual, referred to the "Virgin Islands"

but did not differentiate between the British Virgin Islands and the U.S. Virgin Islands.

32. The Deepwater Horizon switched from Panama to the Marshall Islands in 2004. Transocean, the owner of the Deepwater Horizon, has 35 vessels registered in the Marshall Islands. Transocean moved from the Cayman Islands to the Swiss canton of Zug in 2008. For Zeder and the Marshall Islands, see U.S. Office of Insular Affairs, "Fred Monroe Zeder: In Memoriam," http://www.doi.gov/oia/press/2004/fred_zeder.htm. While Bush's ambassador to the region, Zeder's private company, Island Development, became incorporated on October 14, 1986, four days before Zeder signed a treaty providing for $6 million in aid for the Marshall Islands, of which $1.2m was used to help set up the ship registry. Zeder died in 2008. See "Bush Friend, Former Ambassador: Company Wasn't Disclosed," Associated Press, reproduced in The Victoria Advocate, April 30, 1990. The United States is responsible for foreign affairs and defense, just as the UK is responsible for the foreign affairs and defense of its Overseas Territories. Khadija Sharife in the London Review of Books blog ("Offshore Exploitation," June 9, 2010) established that "During a joint hearing to investigate the explosion and sinking of the Deepwater Horizon, Hung Nguyen, a captain in the Coast Guard, was surprised to learn from the US Interior Department's Mineral Management

Service— the unit responsible for overseeing offshore exploitation—that 'there is no enforcement.' Each operator 'self-certifies and establishes what they think is adequate,' . . . This system of self-regulation was formulated by Dick Cheney's Energy Task Force."

33. Khadija Sharife, "Offshore Exploitation," London Review of Books blog, June 9, 2010.

34. About the Liberian Registry, see Liberian International Ship & Corporate Registry (LISCR, LLC), www.liscr.com, accessed September 30, 2010. For the Standard Oil link, see Andrew Leonard, "Big Oil's Slick Trick," Business Spectator, May 15, 2010.

35. Jeffrey Robinson, The Sink: How Banks, Lawyers and Accountants Finance Terrorism and Crime—and Why Governments Can't Stop Them (London: Constable & Robinson Ltd., 2003), p. 63.

36. Widely cited. See, for example, Simon Raftopolous, "Tax Havens: The Red Herring of the Global Financial Crisis," Appleby Global press release, May 2009, www.appleby-global.com.

37. The Economist, however, has called tax havens "good for the financial system" and routinely carries advertisements for offshore corporations on its back pages.

38. See "World Governments Chip Away at Bank Secrecy," German Press Agency, April 12, 2010.

39. Nicolas Sarkozy, "Just Ahead of the G20 Pittsburgh Summit," from "Paradis fiscaux: bilan du G20 en 12 questions," CCFD-Terre Solidaire, April 2010.

40. For a list of uncooperative tax havens, see OECD Center for Tax Policy and Administration, http://www.oecd.org/document/57/0,3343,en_2649_33745_30578809_1_1_1_1,00.html, accessed 2010. At the time of writing, countries could get off the blacklist by signing 12 "tax information exchange agreements" (TIEAs) with other jurisdictions—relying on extremely weak standards of information exchange. Many havens got off the blacklist by signing TIEAs with such global heavyweights as Greenland and San Marino.

42. That is a gross figure. See "The Dutch Trust Industry: Facts and Figures," International Management Services Association (VIMS) & Dutch Fiduciary Organization

(DFA), April 2008.

43. Author's interview with Morgenthau, New York, May 4, 2009.

44. Oliver Arlow, "Kim Jong-il Keeps 4bn Emergency Fund in European Banks," The Telegraph, March 14 2010.

45. Dev Kar and Devon Cartwright Smith, Illicit Financial Flows from Developing Countries, 2002–2006 (Washington, D.C.: Global Financial Integrity, 2008). The authors define illicit money as that which is "illegally earned, transferred or utilized." Economists from the Oxford Centre for Business Taxation have called these figures "drastically overstated." Dev Kar, the GFI economist (formerly an IMF Senior Economist), has in turn effectively countered their arguments, noting the blind spot in traditional estimates. Traditional models will estimate the magnitude of illicit outflows from a country, then estimate the magnitude of illicit inflows, and then subtract one from the other to achieve a net result. Kar explains, however, that the estimates should not be subtracted, but added. For further details, see "Time to Bury the Oxford Report," Tax Justice Network blog, July 16, 2009, plus associated links; and Dev Kar, "The Alpha, but Whither the Omega, of the Greek Crisis?" Task Force on Financial Integrity & Economic Development blog, May 11, 2010.

6. Knightley, The Rise and Fall of the House of Vestey, p. 63.
7. Ibid., p. 27.
8. Leslie Bethell, ed., Cambridge History of Latin America, vol. 8 (Cambridge: Cambridge University Press, 1991).
9. "A: The Secretary of the Treasury," Washington, D.C., May 29, 1937, from Henry Morgenthau to FDR, from Franklin D. Roosevelt Presidential Library; given to author in 2008 by Morgenthau's son Robert Morgenthau, then Manhattan district attorney.
10. For instance, in 1899 the state allowed corporations to own equity in other corporations, setting the scene for the emergence of large, interlinked networks of companies, the multinational corporation, and transfer pricing activities.
11. Some of this analysis is derived from Ronen Palan, Richard Murphy, and Christian Chavagneux, Tax Havens: How Globalization Really Works (Ithaca, NY: Cornell University Press, 2010).
12. Most accounts say it was Bedford Gunning Jr. who made that statement at the constitutional convention.
13. When Britain decided to tax the worldwide profits of any person resident in the UK, the judges decided that in the case of corporations they should be treated as resident where the company's most important decisions were taken, at meetings of their boards of directors. This suited Britain, since thousands of firms with activities all over the world were financed through the City of London, and their boards were normally located there.

Germany, by contrast, placed more emphasis on the "seat of management"—that is, where the company's actual operations were managed—a subtly different definition. For more on this history, see Sol Picciotto, International Business Taxation (London: George Weidenfeld and Nicholson Ltd, 1992), pp. 4–13.

14. Until then, tax had not been a big issue for the Vesteys because Britain did not tax British-based companies on profits they made overseas—that is, unless they repatriated these profits. This had suited the brothers, who argued that most of their profits arose overseas.

15. Picciotto, International Business Taxation, pp. 1–37.

16. Knightley, The Rise and Fall of the House of Vestey, p. 34.

17. Some tax havens claim that trustees are required by law to know the identity of all beneficiaries. Contacts indicate, however, that generally offshore jurisdictions do not adequately police these laws, and trustees often do not know the real beneficiaries.

18. The U.S. Internal Revenue Service sums it up quite simply: "Although these schemes give the appearance of separating responsibility and control from the benefits of ownership, as would be the case with legitimate trusts, the taxpayer in fact controls them." See Internal Revenue Service, "Abusive Trust Tax Evasion Schemes—Facts (Section I)," June 12, 2008, http://www.irs.gov/businesses/small/article/0,id=106537,00.html.

19. Vestey's (Lord) Executors and another v. Inland Revenue Commissioners. Same v. Colquhoun (Inspector of Taxes.) Same v. Inland Revenue Commissioners, All England Law Reports, May 28, 1949, p. 1108.

20. Sol Picciotto also describes this in his "Offshore: The State as Legal Fiction," in Mark P. Hampton and Jason P. Abbott, eds., Offshore Finance Centres and Tax Havens: The Rise of Global Capital (New York: Macmillan, 1999), pp. 43–79.

21. Obituary: Edmund Hoyle Vestey, 1932–2007, Blue Star Line, http://www.bluestarline.org/edmund_vestey2.htm, accessed Sept 12, 2010.

CHAPTER 3 THE OPPOSITE OFOFFSHORE

1. Robert Skidelsky, John Maynard Keynes: Fighting for Freedom, 1937–1946

(New York: Penguin, 2000), p. xiv.

2. Ibid., p. xv.

3. Ibid., preface and p. 98.

4. See Thomas Friedman, “Foreign Affairs Big Mac I,” New York Times, December 8, 1996. The claim ended in March 1999 when NATO forces bombed Belgrade.

5. John Maynard Keynes, “National Self-Sufficiency,” The Yale Review 22, no. 4 (June 1933): 755–769.

6. Robert Skidelsky, John Maynard Keynes: Hopes Betrayed 1883–1920 (London: Macmillan, 1983), p. 220.

7. Robert Heilbroner, The Worldly Philosophers: The Lives, Times and Ideas of the Great Economic Thinkers (Austin, TX: Touchstone, 1999), p. 251.

8. Skidelsky, Fighting for Britain, p. 92.

9. Ibid., p. 112.

10. Ibid., p. 432.

11. Robert Skidelsky, John Maynard Keynes: Fighting for Freedom, 1937–1946 (New York: Penguin, 2000), p. xxii.

12. J. Bradford DeLong, review of Skidelsky, John Maynard Keynes: Fighting for Britain 1937–1946, July 2001, http://www.j-bradford-delong.net/Econ_Articles/Reviews/skidelsky_jel.html.

13. Helleiner, States and the Reemergence of Global Finance, p. 4.

14. Skidelsky, Fighting for Britain, pp. 340, 348.

15. Barry Eichengreen, ed., Europe’s Post-War Recovery (Cambridge: Cambridge University Press, 1995), p. 99.

16. Geoff Tily, the author of a book on Keynes, believes that the main reason Keynes supported capital controls was his belief that interest rates should be set and held low. This would place Keynes firmly on the side of the industrialist (for whom interest payments were a cost) against the financier (for whom interest payments were income). See Geoff Tily, “The Policy Implications of the General Theory,” Real-World Economics Review, no. 50 (2009): 16–33, http://www.paecon.net/PAEReview/issue50/Tily50.pdf.

17. Capital controls had emerged during the First World War as countries had sought to stop capital fleeing their countries in order to be able to tax capital income and keep interest rates low in order to finance their war efforts. Controls evaporated after the war, following lobbying by bankers, but then returned partially during the Great Depression and finally swept the world after the Second World War and the Bretton Woods arrangements. They slowly became leaky and then were progressively

dismantled around the world from around the 1970s. The United States got rid of its most important controls in 1974.

18. Eric Helleiner, "Regulating Capital Flight," in Gerald A. Epstein, ed., Capital Flight and Capital Controls in Developing Countries (Cheltenham: Edward Elgar, 2005), pp. 290–91.

19. Helleiner, States and the Reemergence of Global Finance, p. 58.

20. Ibid., p. 59.

21. Ha-Joon Chang, Bad Samaritans: The Guilty Secrets of Rich Nations and the Threat to Global Prosperity (London: Random House, 2007), p. 27.

22. Dani Rodrik and Arvind Subramanian, "Why Did Financial Globalization Disappoint?" IMF Staff Papers (2009), pp. 56, 112–138. They seek other explanations, especially exchange-rate factors, for the disappointing performance of liberalized economies, but they do note the close correlation. Also see Monique Morrissey and Dean Baker, "When Rivers Flow Upstream: International Capital Movements in the Era of Globalization," Center for Economic Policy Research Briefing Paper, March 2003. "A striking feature of the distribution of current account surpluses and deficits among developing countries is that most of the countries that are experiencing high GDP growth have surpluses, and often large surpluses…. The fact that most of these nations continue to experience rapid GDP growth, in spite of this large outflow of capital, suggests that the availability of capital has not been a major impediment to economic growth."

23. Martin Wolf, "This Time Will Never Be Different," Financial Times, September 28, 2009.

24. "Capital Inflows: The Role of Controls," IMF Staff Position Note, February 19, 2010.

CHAPTER 4
THE GREAT ESCAPE

1. Catherine R. Schenk, "The Origins of the Eurodollar Market in London: 1955–1963," Explorations in Economic History 35, no. 2 (1998): 221–238.

2. Ibid., p. 225.
3. Ibid., p. 227.
4. Anthony Sampson, Who Runs This Place?: The Anatomy of Britain in the 21st Century (London: John Murray, 2005), p. 246.
5. David Kynaston, The City of London Volume IV: A Club No More 1945–2000 (London: Pimlico, 2002), p. 54.
6. Ibid.
7. U.S. banks had started expanding overseas after the First World War but mostly in Latin America and Asia, and in the 1950s their presence was still hardly discernible in London.
8. E. A. McCreary, The Americanization of Europe: The Impact of Americans and American Business on the Uncommon Market (1964), quoted in Stefano Battilosi and Youssef Cassis, European Banks and the American Challenge: Competition and Cooperation in International Banking under Bretton Woods (Oxford: OUP, 2002).
9. Until then, London's role as a financial center had been based primarily on the British Imperial currency zone, whose member countries banked in London and whose nations used the pound sterling as their currency or pegged their currencies to the pound. Inside the zone trade and capital could flow quite freely, but flows in and out of the area were closely controlled. The pound sterling still financed about 40 percent of world trade, and the Bank of England wanted it to stay that way. See Gary Burn, The Reemergence of Global Finance (New York: Palgrave, 2006), p. 26.
10. These terms are a bit of a misnomer today: They are neither named after today's euro currency nor are they a creature only of American dollars. All the world's main currencies are traded in this stateless unregulated space today.
11. "With the creation of the Euromarket," wrote Helleiner, "bankers in both countries stumbled on a solution to the problem of how to reconstruct the London- New York financial axis that had been prominent in the 1920s." Helleiner, States and the Reemergence of Global Finance, p. 89.
12. P. J. Cain and A. G. Hopkins, British Imperialism: Crisis and Deconstruction 1914–1990 (London: Longman, 1993), p. 293.
13. Quoted in Kynaston, The City of London Volume IV, pp. 696–97.
14. Ibid., p. 697.
15. See "Linklaters Sees Fallout from Repo 105," Financial Times, March 13, 2010; and "Report of Anton R. Valukas, Examiner," Southern District Court, Jenner & Block LLP, vol. 3 of 9, March 11, 2010. The loophole was neither purely a UK matter nor a U.S. matter but derived from arbitrage between the two

jurisdictions. See "FSA on Defensive over Lehman Failings," Financial Times, March 18, 2010.

16. In this process an investment bank, say, lends money to a hedge fund, and the hedge fund posts collateral against that loan, but then the investment bank is allowed to reuse this collateral for its own business, as if it were its own collateral.

17. See Manmohan Singh and James Aitken, "The (Sizable) Role of Rehypothecation in the Shadow Banking System," IMF Working Paper WP/10/172, IMF, July 2010. See also Gillian Tett, "Web of Shadow Banking Must Be Unravelled," Financial Times, August 12, 2010. If you take this practice into account, the IMF reckoned, then the shadow banking system in the United States—the giant, unregulated financial marketplace that lay at the heart of the global financial catastrophes that erupted from 2007—was in fact a full 50 percent bigger than had previously been thought. The IMF concluded that "the United Kingdom provides a platform for higher leveraging not available in the United States."

29. Some illustrative comparative data is provided at Ann Hollingshead, "Bamboozled!," Task Force on Financial Integrity blog, October 16, 2009.

30. When Lee Kwan Yew approached the Bank of England for support in setting up an offshore market, it was less encouraging, saying that it supported Hong Kong as a financial center instead. See Lee Kwan Yew, From Third World to First: The Singapore Story, 1965–2000 (Singapore: Singapore Press Holdings, 2000), p. 90.

31. This was widely reported. E.g., Netty Ismail, "Morgan Stanley Fallout from Andy Xie Costs More Jobs," Bloomberg, October 12, 2006; and Netty Ismail,

"Morgan Stanley Fallout From Andy Xie Costs More Jobs (Update1)," Bloomberg, October 12, 2006.

CHAPTER 6 THE FALL OF AMERICA

1. From author's interview with Hudson, New York, 2008.
2. These days, it is intangibles like patents or brands that are most often abused: Transfer mispricing on oil is much harder because the market price of oil is widely known.
3. As told to author by Hudson in New York in 2008; the memo is reproduced on p. 33 of the 2004 paperback edition of Tom Naylor's Hot Money and the Politics of Debt, 3rd ed. (McGill-Queen's University Press).
4. Raymond Baker, Capitalism's Achilles Heel: Dirty Money and How to Renew the Free Market System (Hoboken, NJ: John Wiley & Sons, 2005). Baker is a world authority on illicit cross-border financial flows. The chapter 4 table entitled "Specified Unlawful Activities under U.S. Anti-Money Laundering Laws" lists 65 crimes—aircraft piracy, human trafficking, alien smuggling, bank fraud, bribery, ocean dumping, and so on—that can be used as a basis for money- laundering charges under U.S. law. The table then cross-checks each crime against two columns: first, if the crime underlying the money flow is committed in the United States; and second, if the crime is committed overseas. The table shows all 65 crimes triggering U.S. money-laundering laws if the crime is committed in United States. But if the crime is committed overseas, three-quarters of them—including alien smuggling, racketeering, peonage, and slavery, and nearly all forms of tax evasion—are excluded from the "prohibited" list.
5. See, for example, "US Bankers Attack IRS Deposit Interest Reporting Requirement," Tax News, December 3, 2002.
6. "Miami: The Capital of Latin America," Time, December 2, 1993.
7. See Naylor, Hot Money and the Politics of Debt, p. 292.
8. Author's interviews with Blum.
9. Blum, by correspondence, and Naylor, Hot Money and the Politics of Debt, p. 293.
10. This was the Interest Equalization Tax. The Kennedy

speech on this subject is available at the American Presidency Project, http://www.presidency.ucsb.edu/ws/index.php?pid=9349.

11. The tax did not cover loans, so many corporations simply switched from bond financing to lending. To check bank loans to foreign countries, the U.S. Congress enacted the Voluntary Foreign Credit Restraint Program (VFCRP) in February 1965, broadening it in 1966. U.S. corporations were asked to voluntarily limit their direct foreign investment. The program was made mandatory in 1968. Capital controls were relaxed in 1969 and phased out in 1974, after the United States left the Bretton-Woods system of fixed-exchange rates. See, for example, "Introduction to Capital Controls," St. Louis Fed. Review, November/December 1999, p. 24.

12. This "deferral," as it is known, was not uniformly available. The Kennedy administration had enacted Subpart F of the Code in 1962, which defended against tax havens by curbing deferral of U.S. corporate taxes in certain situations, deeming the income of foreign subsidiaries and affiliates of U.S. corporations to have been distributed to the U.S. parent and taxed in the U.S. even though this income is not actually distributed.

13. Some countries have limited defenses against deferral; so-called "Subpart F" legislation in the United States (disallowing deferral on passive income) is an example. Even this defense is patchy, however, and developing nations usually find it impossible to construct meaningful defenses using this strategy.

14. David Cay Johnston, Perfectly Legal: The Covert Campaign to Rig Our Tax System to Benefit the Super Rich—and Cheat Everybody Else (New York: Penguin, 2003).

15. Eric Helleiner, States and the Reemergence of Global Finance: From Bretton Woods to the 1990s (Ithaca, NY: Cornell University Press, 1996), pp. 135–6. "Ironically the triumph of 'monetarism' seemed to be occurring at just the time that international linkages were reducing the

Fed's ability to control the monetary base."

16. Ibid., p. 137.

17. Ronen Palan, The Offshore World: Sovereign Markets, Virtual Places, and Nomad Millionaires (Ithaca, NY: Cornell University Press, 2003), p. 134.

18. The Federal Reserve Bank of St. Louis, which studied the new offshore IBFs, noted that the decline in Caribbean business "suggests that the growth of business in this area was almost entirely intended to bypass U.S. monetary regulations." See K. Alec Chrystal, "International Banking Facilities," St. Louis Fed. Review, April 1984, https://research.stlouisfed.org/publications/review/84/04/International_Apr1984.pdf.

19. Mark Hampton, The Offshore Interface: Tax Havens in the Global Economy (London: Macmillan, 1996), p. 63.

20. Palan, The Offshore World, p. 135.

21. Author's interview with Rosenbloom, December 1, 2009.

22. The Portfolio Interest Exemption.

23. Author's interview; also see Testimony of Michael J. McIntyre and Robert S. McIntyre on Banking Secrecy Practices and WealthyAmerican Taxpayers before the U.S. House Committee on Ways and Means, Subcommittee on Select Revenue Measures, March 31, 2009.

24. Testimony of Michael J. McIntyre and Robert S. McIntyre on Banking Secrecy Practices and WealthyAmerican Taxpayers Before the U.S. House Committee on Ways and Means Subcommittee on Select Revenue Measures, March 31, 2009, http://www.ctj.org/pdf/mcintyresw&mtestimony20090331.pdf.

25. The U.S. Foreign Account Tax Compliance Act (FATCA) of 2010 tightens up some aspects of the QI rules, making it harder for U.S. tax cheats, but it leaves the secrecy for foreigners in place. See "FATCA: New Automatic Info Exchange Tool," Tax Justice Network, May 18, 2010.

26. See Michael J. McIntyre, "How to End the Charade of Information Exchange," Tax Notes International, October 26, 2009, p. 194.

27. Much of the information comes from "Failure to Identify Company Owners Impedes Law Enforcement," Hearing Senate Permanent Subcommittee, November 14, 2006. Also "U.S. Corporations Associated with Viktor Bout," Prepared by Senate Permanent Subcommittee on Investigations, November

2009, on Senator Carl Levin's webpage, levin.senate.gov.

28. "Failure to Identify Company Owners Impedes Law Enforcement," Hearing Senate Permanent Subcommittee, November 14, 2006, p. 3.

29. L.J. Davis, "Delaware Inc.," New York Times, June 5, 1988.

30. Corp 95, http://www.corp95.com/, accessed June 10, 2010.

31. The forms of secrecy are different: lack of corporate transparency in Delaware and lack of financial transparency in Switzerland.

32. "Failure to Identify Company Owners Impedes Law Enforcement," Hearing Senate Permanent Subcommittee, November 14, 2006. A new act was introduced in 2008, the Incorporation Transparency and Law Enforcement Assistance Act, aiming to beef up transparency in this area. At the time of writing, the bill was on the sidelines.

33. Jeff Gerth, "New York Banks Urged Delaware To Lure Bankers," New York Times, March 17, 1981.

34. Chancery courts emerged out of English ecclesiastical courts and trust laws, where concepts of legal guardianship and fiduciary duty were paramount, and this makes them useful for what Delaware's Court of Chancery does most of all: rule on the nitty-gritty of how corporations organize themselves internally, and what happens when things go awry: whether internal rules have been followed, whether management insiders are illegally abusing shareholders, and whether corporate statutes were applied fairly. The Chancery court has no close competitor in this arena.

35. Bernard S. Black, "Shareholder Activism and Corporate Governance in the United States," New Palgrave Dictionary of Economics and the Law 3 (1998): 459–465, http://papers.ssrn.com/sol3/papers.cfm?abstract_id=45100.

38. Madhav Mehra, "Are We Making a Mockery of Independent Directors?"

World Council for Corporate Governance, http://www.wcfcg.net/ht130304.htm, accessed August 15, 2010. Dr. Madhav Mehra is president of the council.

39. There are salient differences with the Cayman Islands. For example, most Cayman companies (the "exempt" companies) are by Cayman law not permitted to do business in Cayman. Such is not the case in Delaware. Also: typically, in Delaware, federal but no state taxes are paid; in Cayman, no taxes are paid.

40. Twelve thousand was the figure cited; the true figure is closer to eighteen thousand.

41. List of Delaware Registered Agents, Delaware Department of State division of corporations, corp.delaware.gov, http://corp.delaware.gov/agents/agts.shtml, accessed August 15, 2010.

42. The 2008 and 2007 reports are available at the state of Delaware's official website, http://sos.delaware.gov/2008AnnualReport.pdf.

43. Transcript of interview with Mrs. Ngozi Okonjo-Iweala, Nigerian finance minister, interview by Paul Vallely, The Independent, May 16, 2006, http://www.independent.co.uk/news/world/africa/transcript-of-interview-with-mrs-ngozi-okonjoiweala-nigerian-finance-minister–478337.html.

44. Transparency International has started to embrace this issue and called in November 2008 for a "second wave" of corruption campaigning to tackle these and other matters. As I write this, it is in the process of reevaluating its stance.

CHAPTER 7 THE DRAIN

1. "Interview: John Moscow," Money Laundering Bulletin, April 1997.
2. A range of estimates for the size of the narcotics trade exists. This one comes from "The Global Narcotics Industry," Center for Strategic and International Studies, Washington, D.C., http://csis.org/programs/transnational-threats-project/past-task-forces/-global-narcotics-industry.
3. Based on the current price of $75 per barrel.
4. This section on BCCI is drawn mostly from Peter Truell and Larry Gurwin, False Profits: The Inside Story of BCCI, the World's Most Corrupt Financial Empire (New York: Houghton Mifflin, 1992); from Jeffrey Robinson, The Sink: How Banks, Lawyers and Accountants Finance Terrorism and Crime—and Why Governments Can't Stop Them (London: Robinson Publishing, 2004); as well as various newspaper and academic reports, plus author's interviews with Robert Morgenthau and Jack Blum in 2008 and 2009.
5. For most of its life, Ernst & Whinney (now Ernst & Young) audited BCCI Luxembourg, while Price Waterhouse (now PWC) audited BCCI Cayman.
6. See Peter Truell and Larry Gurwin, False Profits: The Inside Story of BCCI, the World's Most Corrupt Financial Empire (New York: Houghton Mifflin, 1992), p. 87.
7. Ibid., p. 189.
8. Ibid., pp. 193–97 and pp. 290–91; and Robinson, The Sink, pp. 79–81. Some of the capital was real money, but much of it was not.
9. Author's interview with Morgenthau, May 4, 2009. Morgenthau didn't name Scott, but he was the attorney general at the time.
10. Ibid.
11. Robinson, The Sink, pp. 318 and 357.
12. Ibid., p. 84.
13. In 2009, Britain's Information Commissioners refused a Freedom of Information request by Prem Sikka finally to publish PriceWaterhouse's

1991 "Sandstorm" report on BCCI, in an extraordinary and long-winded reply arguing that "it is very clearly in the public interest that the UK maintains strong and effective relations with its international partners"—a clear defense of tax haven London. See Freedom of Information Act 2000 (Section 50), Decision Notice, December 14, 2009, Information Commissioners (UK), http://www.ico.gov.uk/upload/documents/decisionnotices/2009/fs_50202116.pdf. In an email to the author on June 15, 2010, Sikka said he remained committed to securing publication of the report. Sikka also provides a useful in-depth examination of the BCCI affair in Austin Mitchell, Prem Sikka, Patricia Arnold, Christine Cooper, and Hugh Will-mott, "The BCCI Cover-Up," Association for Accountancy & Business Affairs, 2001, http://visar.csustan.edu/aaba/BCCICOVERUP.pdf.

14. Author's interview with Morgenthau, May 4, 2009; and "More Offshore Tax Probes in Works: NY's Morgenthau," Reuters, April 27, 2009.

15. See the author's Poisoned Wells: The Dirty Politics of African Oil (New York: Palgrave, 2007).

16. French magistrates issued an international arrest warrant for Gaydamak in January 2001, and he moved to Moscow; in October 2009 he was convicted in absentia for arms trafficking, fraud, and tax offenses. Gaydamak says the magistrates used forged documents and said he owed no French taxes because he had been resident in London at the time in question. Author's interview with Gaydamak, and Le Monde, December 8, 2000, cited in Global Witness, All the President's Men, 2002, p. 26.

17. The arms he helped finance did, it is true, hasten victory over UNITA, though not everyone would agree that helping supply arms constitutes "bringing peace." Gaydamak had recently bought the Israeli football team Hapoel and a basketball team, Betar Jerusalem, with, he said, political aims.

18. Russia agreed, with Gaydamak's help, to cut the debt down to just $1.5 billion, sliced into 31 promissory notes with a face value of $48.3 million each.

Angola would pay these off at face value in six monthly installments, after a five-year grace period, from 2001 to 2016. Gaydamak and his partner Pierre

Falcone then set up a private company, Abalone Investments, with an account at UBS in Geneva. Abalone bought the 31 notes from Russia for $750 million

—at a 50 percent discount—though Angola would pay Abalone the $1.5 billion in full. Angola's state oil company Sonangol started paying money

into the Abalone account via the controversial and secretive oil trader Glencore. In February 2001, after 16 of the 31 notes (or $774 million) had been paid off, the Swiss judge froze the remaining 15 notes.

19. Global Witness, Time for Transparency, March 2004, p. 44.

20. Over $160 million went to an account called "Treasury Ministry of Finance" in Moscow, though knowledgeable sources in Switzerland told me that despite its name, this account may have been a front, with other interests behind it.

21. Le Monde, April 3, 2002: "Le règlement de la dette angolaise aurait donné lieu à des détournements de fonds," quoted in Global Witness, Time for Transparency, March 2004. I asked Gaydamak if the money had simply disappeared into private pockets, offshore. No, he said: Instead of paying Russia in cash for the promissory notes, Abalone paid Russia in "Russian obligations"—Russian debts he bought on secondary markets via these mysterious offshore companies and then redeemed to Russia—and Abalone had legally profited on those debt trades too. It was a "huge stupidity," he said, to assume that he would pay Russia back directly, rather than via intermediary accounts.

22. Dev Kar and Devon Cartwright-Smith, "Illicit Financial Flows from Africa: Hidden Resource for Development," Global Financial Integrity, March 26, 2010. Dev Kar is a former senior IMF economist.

23. See "'Angolagate' Revisited," Global Financial Integrity, Task Force on Financial Integrity & Economic Development, April 7, 2010, http://www.financialtaskforce.org/2010/04/07/angolagate-revisited/.

24. IMF data, "Angola: Selected Issues and Statistical Annex," April 1999 and Sept. 2003, and "Angola, Recent Economic Developments," Dec. 1995, Dec. 1997, Sept. 2000; "IMF Executive Board Concludes 2004 Article IV Consultation with Angola," July 2005.

25. The Soyo-Palanca Trust and the Cabinda Trust were used as efficient mechanisms for routing Angola's oil money, enabling Angola to provide trustworthy collateral for oil-backed loans, ring-fenced from the inefficiencies of Angola's domestic financial system. The problem was, essentially, that this ring-fencing also meant it was off the Angolan state's balance sheet, and therefore outside any normal budgetary or political procedures, playing havoc with Angola's ability to run a coherent budget.

26. Some economists, many with ties to the financial services industry and

to tax havens, have tried to dispute these numbers—none successfully. In fact, the numbers are quite compatible with the only comparable official estimate available—a World Bank study from 1994, which estimated total capital flight from developing countries at $155–377 billion in 1992: Simply extrapolating this figure to 2006 dollars (using the IMF conversion rate of 287.2 percent) yields a figure of $443 billion to $1.1 trillion; evidence is, however, that the growth rate has significantly exceeded the inflation rate. For counterarguments and detailed discussions, see "Time to Bury the Oxford Report," Tax Justice Network, July 16, 2009.

January 10, 2008.

37. Chinese ministry of commerce. Total for Hong Kong was $27.7 billion, BVI $16.6 billion; the next largest was South Korea, with $3.7 billion.

38. See, for example, “India Gets 43% FDI through Mauritius Route,” Press Trust of India, April 20, 2009.

39. It was a French colony until Britain invaded during the Napoleonic Wars.

40. Author’s interview with Elmer, 2009.

41. Telephone interview with Rosenbloom, December 1, 2009.

CHAPTER 8
RESISTANCE

1. "Harmful Tax Competition: An Emerging Global Issue," Organization for Economic and Cooperative Development, 1998, http://www.oecd.org/dataoecd/25/26/44430243.pdf.
2. The last major attempt at attacking the havens had been the so-called Gordon report published by the U.S. Internal Revenue Service in January 1981: "Tax Havens and Their Use by United States Taxpayers—An Overview," report to the Commissioner of Internal Revenue, the Assistant Attorney General (Tax Division) and the Assistant Secretary of the Treasury (Tax Policy), submitted by Richard A. Gordon, Special Counsel for International Taxation, January 12, 1981. This was almost entirely ignored.
3. Though the 1998 report did not list the havens, the content was clearly aimed at smaller island centers.
4. Author interview with Dan Mitchell, Washington, D.C., Jan. 16, 2009.
5. David Cay Johnston, "Behind the IRS Hearings, a GOP Plan to End Tax Code," New York Times, May 4, 1998, http://www.nytimes.com/1998/05/04/us/behind-irs-hearings-a-gop-plan-to-end-tax-code.html?pagewanted=1.
6. David Cay Johnston, Perfectly Legal: The Covert Campaign to Rig Our Tax System to Benefit the Super Rich—and Cheat Everybody Else (New York: Penguin, 2003), p. 148.
7. See "The Liberalizing Impact of Tax Havens in a Globalized Economy," presentation by Dan Mitchell, Capitol Hill, March 23, 2009, http://www.youtube.com/watch?v=ISfsY1nqoaM&feature=related.
8. Ibid.
9. Paul de Grauwe and Magdalena Polan, "Globalisation and Social Spending," Cesifo Working Paper No. 885, March 2003, https://lirias.kuleuven.be/bitstream/123456789/119409/1/cesifo_wp885.pdf.
10. "Table A. Total Tax Revenue as Percentage of GDP," OECD, http://www.oecd.org/dataoecd/48/27/41498733.pdf.
11. "A Fair Share: Has the Tide Turned for Corporate Profits?" The Economist, August 27, 2009, http://www.economist.com/research/articlesBySubject/displaystory.cfm?sub

41. Telephone interview with Rosenbloom, December 1, 2009.

jectid=2512631&story_id=E1_TQPNSGGV. In 2006, for example, just ahead of the economic crisis, U.S. corporate profits were higher as a share of national income, and wages and salaries were lower, than at any time since the Second World War.

12. See David Cay Johnston, "Tax Rates for Top 400 Earners Fall as Income Soars, IRS Data," Tax Analysts , undated, 2010, http://www.tax.com/taxcom/features.nsf/Articles/0DEC0EAA7E4D7A2B852576CD00714692?OpenDocument.

13. Mitchell's own book quotes a seminal 2006 European study that baldly explains the problem: "The effect [of falling tax rates] on incorporation is significant and large. It implies that the revenue effects of lower corporate tax rates—possibly induced by tax competition—partly show up in lower personal tax revenues rather than lower corporate tax revenues…. There is reason (after all) to worry about tax competition." "Corporate Tax Policy, Entrepreneurship and Incorporation in the EU," CESifo Working Paper No. 1883, December 2006. Also see Lucas Bretschger and Frank Hettich, "Globalisation, Capital Mobility and Tax Competition: Theory and Evidence for OECD Countries," European Journal of Political Economy 18, no. 4 (November 2002); and S. Ganghof, The Politics of Income Taxation: A Comparative Analysis (European Consortium for Political Research Press, 2006).

14. Michael Keen and Alejandro Simone, "Is Tax Competition Harming Developing Countries More Than Developed?" Tax Notes International 1317, June 28, 2004.

15. Alexander Klemm and Stefan van Parys, "Empirical Evidence on the Effects of Tax Incentives," IMF Working Paper No. 09/136, July 1, 2009, http://www.imf.org/external/pubs/cat/longres.cfm?sk=23053.0.

16. One such incentive was the tax holiday, which the IMF economists said was "widely regarded as the most pernicious form of incentive." Britain had briefly tried this gimmick under Prime Minister Margaret Thatcher until it became clear they did not work: set up a ten-year tax holiday, and companies will pack up and leave after nine years and 11 months, or will transfer the business to another subsidiary and get another ten-year holiday. After these failures, however, Africa was still encouraged to embrace them: In 1990 only one sub-Saharan African country offered tax holidays, but a decade later they all did. Often these holidays are available in special export processing zones, which are a bit like small offshore

41. Telephone interview with Rosenbloom, December 1, 2009.

jurisdictions lodged inside the state. When these zones pop up, wealthy locals who want to invest at home inevitably send their money overseas, dress it up in an offshore secrecy structure, then return it, slashing their tax bill in the process.

17. Daniel J. Mitchell, The Moral Case for Tax Havens, video, Center for Freedom & Prosperity, October 2008.

18. This history is explored in more detail in the UK edition of this book, in chapter 3 on Switzerland. 40. Michael J. McIntyre, "How to End the Charade of Information Exchange," Tax Notes International, October 26, 2009.

http://www.idea.int/vt/survey/voter_turnout_pop2.cfm.

32. "Offshore Hazard: Isle of Jersey Proves Less Than a Haven to Currency Investors," Wall St. Journal, September 17, 1996.

33. Aletter in October 1996 from Colin Powell, Jersey's Chief Adviser, to Pierre Horsfall, President of Jersey's Finance and Economics Committee, suggests the uncertain official position at the time. "Some might hold the view that there is nothing wrong with States members being directors of local companies," the letter read. "Indeed, for as long as States members are not full-time and salaried it is almost inevitable." The answer that had been put forward, Powell said, was to set up a Jersey Financial Services Commission to supervise the finance industry—though that, he conceded, may not be very different. "The Commission will include those who have a direct interest in the finance industry." The answer, Powell said, was to make sure that those in the future

commission would not be involved in particular areas where they had a conflict of interest, and that the matter should be debated further. (Letter from Colin Powell, O.B.E, Chief Adviser to the States, to Senator P.F. Horsfall, President, Finance and Economics Committee, October 25, 1996.)

34. "Finance: Damage Might Be Done to Jersey's Reputation," Jersey Evening Post, February 15, 1996.

35. Accountancy Age, March 29, 2001, p. 22.

36. Prem Sikka and Hugh Willmott, "All Offshore—The Sprat, The Mackerel, Accounting Firms and the State in Globalization," Essex Business School Working Paper No. WP 09/05, February 2009.

37. Luca Errico and Alberto Musalem, "Offshore Banking: An Analysis of Micro- and Macro-Prudential Issues," IMF, January 1999. Also: "Favourable regulatory treatment in OFCs increases the operational leeway of offshore banks for balance sheet management," the IMF said: "exemptions from reserve requirements on deposits; liquidity requirements; liability and asset concentration restrictions; capital adequacy thresholds; and stringent foreign exchange position limits, allow offshore banks to more freely manage their balance sheets."

38. For example, in When Genius Failed, Roger Lowenstein's otherwise excellent analysis of the episode, the offshore structure is almost ignored. Roger Lowenstein, When Genius Failed (New York: 4th Estate, 2002).

39. See, for example, "Report on Special Purpose Entities," the Bank for International Settlements, September 2009.

40. As the BIS report puts it: "The onshore (Delaware) versus offshore (Cayman) decision will generally be driven by factors outlined in the previous section (on tax considerations of SPEs), while other (non-taxation related) considerations (such as clarity of legal regime, ease of incorporation, etc) will generally be similar to those outlined for European SPEs immediately above." Note that "clarity of legal regime" and "ease of incorporation" stem specifically from these jurisdictions' offshore status, as defined in this book.

41. See Jim Stewart, "Shadow Regulation and the Shadow Banking System: The Role of the Dublin International Financial Services Centre," Tax Justice Focus 4, no. 2 (July 18, 2008); and Jim Stewart, "Low Tax Financial Centres and the Subprime Crisis: The IFSC in Ireland," presentation, Tax

Justice/AABA
research workshop, University of Essex, July 3–4, 2008. Also, draft version of Jim Stewart, "Low Tax Financial Centres and the Financial Crisis: The Case of
the IFSC in Ireland," May 15, 2010.

42. Dublin's lures for the shadow banks were not especially its low-tax regime—though that helped—but other features: Ireland's wide array of tax treaties, and the fact that it ticks certain boxes that fund regulators require in their home countries, including the fact that certain EU directives apply. Being within the Euro currency zone is also crucial.

43. See Goldman Sachs, "Abacus Prospectus and Abacus Indicative Terms," February 26, 2007, http://www.scribd.com/doc/30054003/Abacus–2007-AC1- INDICATIVE-TERMS.

48. Julie Cresswell, "Profits for Buyout Firms as Company Debt Soared," New York Times, October 4, 2009.

49. Andrew G. Haldane, "Small Lessons from a Big Crisis," Bank of England, May 8, 2009. Haldane is executive director, financial stability. For some excellent examples of this, see Gretchen Morgenson, "Private Equity's Trojan Horse of Debt," New York Times, March 12, 2010; and Julie Cresswell, "Profits for Buyout Firms as Company Debt Soared," New York Times, October 4, 2009.

50. The GFI studies present a range of estimates, with net flows into deficit countries worth hundreds of billions of dollars. See chart 7 in Dev Kar and Devon Cartwright Smith, "Illicit Financial Flows from Developing Countries 2002–2006," Global Financial Integrity, Washington, D.C., 2008, http://www.gfip.org/storage/gfip/economist%20-%20final%20version%201–2–09.pdf.

51. See Rebecca Smith, "Monty's £10,000 Credit Limit," July 28, 2003, http://www.wilmslowexpress.co.uk/news/s/63/63903_montys_10000_credit_li

mit.html.

CONCLUSION

1. The IASB issues International Financial Reporting Standards, which are currently in a process of "convergence" with U.S. accounting standards under the U.S. Financial Accounting Standards Board (FASB), which has a complex, private-led ownership structure but also does not require country-by-country reporting.
2. The World Bank says it "meets the cost/benefit test"; see the World Bank submission to the IASB, June 28, 2010, http://www.ifrs.org/NR/rdonlyres/7FAC2D52-A064–41BD–8BA8–445245232E0B/0/CL55.pdf.
3. Currently the most comprehensive source of updated information available on the topic of information exchange is a section entitled "On Exchange of Information for Tax Purposes" on the website of the Tax Justice Network, http://www.taxjustice.net/cms/front_content.php?idcat=140.
4. "Double Tax Treaties and Tax Information Exchange Agreements: What Advantages for Developing Countries?" Misereor, February 2010.
5. "Tax for Development," OECD Observer, December 2009–January 2010.
6. Campaigns have been established to pursue this. See, for example, Tax Justice Focus 6, no. 1 (2010), which explores land value taxation.
7. This example of the street musician is borrowed from Henry Law, "A Tax That Is Not a Tax," Tax Justice Focus 6, no. 1 (2010), www.taxjustice.net.
8. Raymond Baker, "Transparency First," The American Interest, July–August 2010.
9. This last paragraph is taken from my article coauthored with Raymond Baker and John Christensen in the September–October 2008 edition of the American Interest, entitled "Catching Up with Corruption."

Preface The European Central Bank: the New European Leviathan?

> …the sovereign power, whether placed in one man, as in a monarchy, or in one assembly of men, as in popular, and aristocratical commonwealths, is as great, as possibly men can be imagined to make it. And though of so unlimited a power, men may fancy many evil consequences, yet the consequences of the want of it, which is perpetual war of every man against his neighbor, are much worse.
>
> Thomas Hobbes, *Leviathan* (XX, 136)[1]

Introduction: Hobbes and the European Central Bank

With the 1 January 2002 changeover to the euro complete, one could provocatively argue that the European Central Bank has become the most important institutional creation in Europe since the institutionalization of the nation state in the seventeenth century. While the European Union (EU) may be the larger institutional embodiment of the historical process of supranational governance and European integration in postwar Europe, it is the ECB that perhaps best defines the relinquishing of state sovereignty to an institution with powerful supranational mechanisms of decision-making and enforcement. And while some may contend that the ECB's range of activities are limited to one narrow policy-arena, namely monetary policy, its influence has already spread into other arenas of EU and national policy-making – tax policy, financial regulation, budgetary policy, and macroeconomic policy-making. Acting as a political lever for further European integration, the ECB may just form a core element of an embryonic European super-state.

Whether one agrees or disagrees with this proposition, the creation and operation of the ECB has unleashed a whole range of questions that remain largely unanswered and widely debated. For example, what are the political and economic consequences of the ECB? More importantly, is the ECB emerging as a new European 'Leviathan'?

Has Europe submitted itself, as some would argue, to the rule of a political monster? Are there, in the words of Thomas Hobbes, 'evil consequences' associated with the formation of the ECB? Does the ECB have too much power? If so, can the ECB be controlled? And controlled by whom: member states? Furthermore, within the bounds of a democratic order that must be the foundation of European integration, is the ECB accountable? What about the rights of citizens and national governments alike? Can they provide input into the ECB that adequately reflects the interests and concerns of the member states, interests associations, and the public? This study seeks to address these very difficult questions by providing a comprehensive analysis of the ECB's actions and operations.

It should be made clear that we do not contend that the ECB is a political monster – a Leviathan, in the language of Hobbes. Moreover, we argue that any comparison between the two should be seen as speculative and designed to arouse some hard thinking about the future of the European Union more broadly, and European Monetary Union, more specifically. At the same time, however, some intriguing comparisons between Hobbes' analysis of the Leviathan and the European Central Bank can be made. It is not too much of a stretch to suggest that the ECB looms powerfully large on the political and economic map of Europe – much like Hobbes' Leviathan would loom large on the political development of Europe. Finally, we do recognise the limitations of Hobbes' controversial theory – especially given the powerful critiques of Hobbes over the centuries. However, the dilemma Hobbes faced is similar to the dilemma faced by Europeans today – namely, how to reconcile individual freedom and political authority.

Let us then assume for analytical purposes that the world is comprised of monetary anarchy, currency against currency, and where rules and order – in other words governance – are in short supply. Moreover, let us assume that the people and nations of Europe have long struggled with the negative consequences of currency competition – from repeated postwar bouts of externally produced instability (largely as a result of US dollar politics), as well as internal (European) bouts of instability caused by asymmetry in governance, lack of common rules and institutions, national self-interest, and the inability to enforce common decision-making. While the European Monetary System sought to provide a safe harbour in a sea of monetary anarchy brought on by the powerful forces of globalization, individual members have frequently pursued their own monetary and economic

interests – most notably Germany, but also France and Great Britain. Much as Hobbes identified 'competition' as a source of conflict, monetary competition and conflict have defined nearly 40 years of European postwar monetary history.

Given this scenario, how might a modern day Hobbes respond to the current state of European monetary politics? First and foremost, Hobbes was concerned with the power to preserve order. In a world that is 'nasty, brutish, and short' the power of the regime – the Leviathan – to preserve order must be absolute.[2] Without a common power over individuals to settle disputes, human beings become hostile to one another largely because they compete for limited resources, because their mistrust of one another forces them to try to protect themselves by dominating others, and because some people seek the glory of appearing superior to others. Considering the selfish passions of people, their fear of the Leviathan is the only reliable way to keep peace among them. In the immortal words of Hobbes, 'Covenants without the sword are but words, and of no strength to secure a man at all' (Chapter XVII, p. 109). Thus, Hobbes insists on the need for a government powerful enough and feared enough to protect individual rights against the aggression of others.

In addition to the creation of a sovereign with absolute power, laws propagated by the sovereign can facilitate the exercise of individual freedom. The goal is:

> not to bind the people from all voluntary actions; but to direct and keep them in such a motion, as not to hurt themselves by their own impetuous desires, rashness or indiscretion; as hedges are set, not to stop travellers, but to keep them in their way (Chapter XXX, p. 227).

To avoid anarchy in which every individual would be a 'law unto himself', government must have the power to regulate all actions. Moreover, the laws are made to assist individuals, not to hurt each other, but rather to join them together against a common enemy. This image of laws as hedges conveys Hobbes' thought that within the boundaries set by the sovereign, individuals are free to live as they please. While Hobbes might not have meant the unalienable individual rights as put forth by John Locke, self preservation and security push individuals to give up some autonomy in return for protection and order. To achieve the peace that makes civilized life possible, individuals must agree to the restraints – the laws or hedges – on their selfish aggressiveness and desire for competition.

Binding Hobbes' analysis of political order and laws is the social contract. Hobbes' social contract covers not only the institution of a government by those who choose the sovereign, but also the submission of all to a conqueror and a set of rules or laws. When people are conquered and submit to the conqueror out of fear, they have thereby given their consent to that government to reign over them. Moreover, those that submit to the government do so out of mutual shared interest. In other words, governmental coercion is necessary to overcome the prisoner's dilemma; coercion is necessary to avoid the catastrophe that would result if every person (state) were free to pursue its own self-interest. Hobbes' notion of the social contract suggests that it is in the long-term interest of all to live in a society that allows people to enjoy the benefits of peaceful cooperation with each other. People know that to secure this beneficial outcome, they have to protect themselves from the temptation to cheat; and they do this by establishing a coercive government. In order to prevent imminent disaster – namely death – individuals give up some measure of autonomy to the sovereign in return for the protection the sovereign provides. Cheaters will be punished.

It is not too far a leap to take Hobbes' understanding of human nature, self interest, and competition and apply it to European monetary politics. The European Central Bank is first and foremost concerned with the power to preserve monetary order. For the European Central Bank, its power must also be near absolute – as denoted by its overriding preoccupation with political independence and autonomy. Furthermore, the ECB should strike fear into the hearts of member states – pursuing a tough monetary policy stance and demanding fiscal rectitude. Without the ECB's power to settle monetary disputes between Euro-Zone members, it is likely that we would see continued monetary conflict, competition for scarce resources (in monetary terms – ensuring price stability while avoiding the burdens of adjustment of a weak currency), general mistrust among European monetary powers, and the ongoing battle over monetary prestige (strong currency status). While the Euro-Zone members might contend that this prediction is too pessimistic, one could counter that we still see some of these activities even within the European Monetary Union and the ECB.

The Maastricht Treaty lays down the binding laws governing the fiscal and monetary behaviour of member states. Primarily, the monetary laws (Article 105) must be guided toward the goal of price stability, not so that low inflation hurts anyone's particular interest, but rather that society and the economy – and importantly individuals – can proceed along an uninterrupted path of stable steady growth. Given

the allusion to hedges in Hobbes' analysis of the necessity of laws, we can see price stability as a hedge against monetary turmoil and economic instability. Even further, particularly from the German perspective, the ECB's independence to pursue price stability can act as a foundation for a stable political order. The ECB acts as a guide, a protector, of European monetary stability, but also the overriding political stability that comes from economic growth and prosperity. In this analysis, the ECB can act as a solid foundation to political union in Europe.

Finally, the Euro-Zone members have given their consent to be governed by the ECB. And the members did so, entering into a binding treaty – the social contract – out of a mutual shared interest in monetary stability and economic growth. To cooperate monetarily required the relinquishing of monetary sovereignty to the ECB. Not surprisingly, European monetary cooperation among nation states has often been analysed in terms of the prisoner's dilemma. The powerful incentive of states to cheat and take advantage of other states is well known throughout Europe's monetary history. The solution, the creation of governance – rules and institutions – that can provide information, enforce decisions, punish cheaters, and demand repeated interaction are at the foundation of the decision to create the ECB. For the Europeans, they have been dealing with this dilemma for the last three decades. In part, they were able to alleviate some of the problems with the ill-fated snake, the more successful EMS, and finally with EMU and the creation of the ECB. It would seem that the ECB has permanently solved the prisoner's dilemma. Other than potential fiscal 'cheaters' (still possible but limited by the Stability and Growth Pact), member states have relinquished their individual right to coin money and regulate monetary policy to the ECB – an ECB sovereign, autonomous, and powerful and reigning in Frankfurt/Main.

It would seem that the ECB fulfills much of the Hobbesian approach to understanding the behaviour of humans – but applied to the behaviour of nation states in an anarchic monetary world. But this brings us back to the question of accountability and the protection of individual and member state interests. How can we reconcile member states' rights with the political authority and power granted to the ECB? We are not quite sure that a perfect balance between these competing goals can be found or that the EU or the ECB have found it either. What we can say is that European monetary policy-making and economic governance in Europe are in a state of transition, a fluid, dynamic situation that will confront policymakers and national governments with difficult choices

between the competing objectives of sovereignty and international (European) cooperation.

Objectives of the book

The principal objective of our study is to provide a detailed analysis of the institutional structure and operation of the ECB, and through this analysis reasonably speculate on the Bank's future operation. Our study seeks to understand why the ECB was designed the way it was, how it fits into the overall EU policy-making system, and the debates about its institutional structure. The book explores the history of European central bank cooperation and co-ordination in the context of European monetary integration. The book also examines the preferences of key national actors (in particular French, German and British) that determined both the organization and independence of the ECB as well as the on-going debates about the Bank's design and operation. The complex issues of legitimacy, accountability and transparency – all within the larger construct of political independence – are explored in the context of member state attitudes and the present and future operation of the ECB. By bringing together in a systematic and comprehensive way the various issues of ECB power and independence, we seek to provide academics, students, analysts and the wider public with an accessible overview. With euro coins at present firmly in the hands of nearly 300 million Europeans, it is now even more imperative that we have a broadly encompassing explanation of the powerful ECB.

The book does not claim to make a definitive theoretical statement about the determinants of European integration or the creation of the European Central Bank. While we feel that the ECB should be considered a major step in the emergence of some unique confederal entity still rooted in its member states, we do not seek to explore the contribution of the ECB and EMU more generally in terms of the progress of European integration: this must be the subject of a future study. However, we do argue that the ECB's structure and operation, its successes and potential weaknesses have had and will continue to have an impact upon the shape of future efforts to create new supranational institutions and policies within the European Union. While some may fear the ECB 'Leviathan', the book argues that the ECB can be held accountable – both through existing structures and policies and possible future developments in European policy-making and institutional change.

Outline of the book

The book is divided into seven chapters. Chapter 1 broadly outlines the theoretical and analytical approaches that can be applied to help explain the logic behind the creation of the ECB, its structure, independence and its current operation. Chapter 2 draws out the historical development of European monetary authority in terms of its development as an 'epistemic community'. Starting in the postwar period, through the debates on EMU in the early 1970s and in the period from 1988 to 1991, and the preparation for the launch of the single currency in January 1999, we provide a detailed analysis of the gradual construction of European monetary authority. In doing so, we seek to provide historically-informed insights into the ECB's structure and power. Chapter 3 explores the prevailing attitudes of the three leading member states of the European Union – Germany, France and Britain – towards European monetary authority and the EMU project more generally, in addition to the distinct national traditions of monetary policy-making that have largely shaped these attitudes.

Chapters 4 and 5 complement each other with a focus on the institutional structure of the ECB and an analysis of ECB independence. Chapter 4 describes the European System of Central Banks (ESCB) and the interaction of the ECB with other EU institutions – especially the Eurogroup, but also other institutions, for example, the European Parliament. Chapter 5 then evaluates the institutional structure of the ECB through the analytical lens of political independence. To what extent is the ECB independent from the influence of key political and policy-makers? Does this independence make the ECB unaccountable and illegitimate in the eyes of the public and politicians? Given the European Union's ongoing struggle with questions of transparency and the democratic deficit, can the ECB operate independently without causing further sacrifice on these concerns? While a great amount of literature has already explored this topic, we review the literature and bring it into the context of the overarching theme of the book.

Using the preceding chapters as a backdrop, Chapter 6 evaluates the ECB in action – the actual monetary policy during its first years in operation. Using the concept of credibility as a framework of analysis, this more journalistic chapter traces the monetary steps of the ECB from July 1998 through the official launch of the euro in 2002. Here we focus on the interest rate debates, exchange rate politics and the role of ECOFIN in more detail and evaluate the ECB's 'successes' and 'failures'. We suggest that the ECB – despite some problems in the area

of policy credibility – is establishing itself and exerting its power more effectively, especially since the introduction of euro notes and coins in 1 January 2002. Finally, Chapter 7 concludes with a summary of the key arguments of our analysis and the expectations of the future behaviour of the ECB. We also draw out some institutional issues related to the future operation of the ECB as well as the European Union.

Methodologically, this book relies on a variety of approaches – including interviews with officials of the European Central Bank and other leading monetary and political officials from a number of member states, reviews of secondary sources and journalistic accounts, and the employment of statistical data. Interviewees were given anonymity in order to encourage discussion and frankness. Although reliability remains a problem with any anonymous interview, the intent was not to pinpoint specific positions or catch an official slip-up, but rather to elicit open reflections on the role of the European Central Bank and other officials in the respective EU member states. The official positions of the ECB are also readily available from source material and published interviews in the press, and one can visit the Bank's web-site at www.ecb.int.

Acknowledgements

We would like to acknowledge the institutional support of West Chester University – in particular the Department of Political Science and the grants of financial support from the Faculty Development Committee and the Dean of the School of Business and Public Affairs, Chris Fiorentino – and the British Academy. We would also like to acknowledge the support and advice of Dr. Hans-Eckart Sharrer, Vice President of the Hamburger Welt-Wirtschaft und Archiv (HWWA) and the staff and members of the European Central Bank in Frankfurt/Main for their time in a number of interviews, email discussions and comments on draft versions. Two reviewers of our first draft, Ivo Mayes from the Belgium National Bank and Amy Verdun at the University of Victoria, provided useful comments and criticisms on the text, as did two anonymous reviewers. Our editors at Palgrave Macmillan, especially Nicola Viinikka, have been patient and reassuring.

Analytical and Theoretical Approaches to the Study of the European Central Bank

> Each (theory) begins [its] analysis from a particular assumption that determines the kind of question that they ask, and therefore the answer they find. They are like … toy trains on separate tracks, travelling from different starting points and ending at different (predetermined) destinations, never crossing each other's path.
>
> Susan Strange, 1994: 16

Introduction: theorizing the European Central Bank

As scholars of the process of European integration, we are aware of the limitations and deficiencies of the state of theory in international relations and comparative politics. Susan Strange's dissatisfaction with the state of theorizing should warn us of the dangers and pitfalls of employing too deterministic a mode of theoretical analysis. The diversity of theories and analytical approaches at our disposal makes the task even more problematic. Europeanist Gary Marks has noted that studying the European Union asks 'us to think anew about political science as a discipline and how its subfields fit together' (Marks 1997: 1). Scholars have been debating the validity of different theoretical approaches since the late 1950s (for a review of the international relations and comparative politics/political economy approaches see Bulmer and Scott (1995) and Rosamond (2000)). Notable works on European Monetary Union (for example, Overturf 1997; Kenan 1995; McNamara 1998; Frieden, Gros and Jones 2000; Eichengreen and Frieden 2001) provide a comprehensive review of various theoretical approaches to the study of monetary integration.

This chapter seeks to explain the strengths and inadequacies of several major theoretical approaches applied to explain the move to

and the operation of EMU and the interlinking question of the structure and operation of an independent ECB and ESCB. We explore both the more traditional European integration approaches – drawing upon international relations theory – which have been widely debunked, in addition to some of the newer approaches which draw on the tools of comparative politics and political economy. The former include neo-realism; a revised neo-realism emphasizing 'voice opportunities' and geo-political developments; liberal intergovernmentalism emphasizing margin of manoeuvre in macroeconomic policy-making and the role of powerful business interests; neo-functionalism; and liberal institutionalism and regime theory. These theories tend to focus on the logic of the move to EMU: the creation and design of the ECB is given less consideration. Nonetheless, traditional theories of European integration provide some insight into the logic behind the structure of the ECB and its operation. We also introduce a structural perspective of international political economy which explains both the move to EMU and central bank independence in term of changes in global capitalism. Comparative politics and political economy offer approaches which, while in some cases paralleling the international relations theories, provide potentially greater explanatory power as to the structure and operation of the ECB. These include historical institutionalism; an analysis of the role of 'epistemic communities'; a cognitivist approach emphasizing the importance of ideas; structuralist explanations focusing on features of the European Community and the European Monetary System (EMS); and rational/public choice explanations including rational institutions building, 'garbage can' models, the problems associated with free-riding and principal–agent theory. This chapter embraces the eclecticism adopted by Sandholtz (1993) which challenges the ability of any one theoretical approach to explain the move to EMU, its institutional design and the operation of the ECB. Our examination here is meant to be a brief overview: it is neither exhaustive nor does it fully capture all the subtleties of each approach. Furthermore, with a couple of exceptions, we do not cover the large amount of theoretically driven literature from the discipline of economics: readers are encouraged to consult Eichengreen and Frieden (2001) among other sources. The insights provided by the different theoretical approaches that we cover here reappear repeatedly in later chapters of this book: in our analysis of the historical development of European monetary authority, of national perspectives on monetary policy-making, the

operation of the ECB, its relations with other EU institutions and member state governments as well as its future. However, our study is not directed by any one theoretical approach.

International relations theories

Neo-realism and geo-politics

Central to the (neo-)realist analysis are the state, geo-political power and the calculations of states. The move to EMU and the transfer of monetary policy-making power to the ECB thus cannot be explained in (neo-)realist terms because the loss of permanent *de jure* national sovereignty. Grieco (1995) develops a 'voice opportunities' thesis as a problematic attempt to salvage (neo-)realism and explain the logic behind the decision of major EC member states to surrender their control over monetary policy (see also Sandholtz (1993) and Howarth (2002a)). Grieco (1995: 34) writes:

> if states share a common interest and undertake negotiations on rules constituting a collaborative arrangement, then the weaker but still influential partners will seek to ensure that the rules so constructed will provide sufficient opportunities for them to voice their concerns and interests and thereby prevent or at least ameliorate their domination by stronger partners.

Thus governments are willing to surrender their *de jure* control in order to regain a degree of *de facto* control in a policy area where they have little. Germany's EMS partners wanted EMU in order to increase their voice in the determination of monetary policy, given that the asymmetric operation of the EMS forced them to follow German policy. Grieco assumes that dissatisfaction with the operation of the EMS meant the necessary embrace of EMU. His explanation quite reasonably presents the imposition of the German design for the European System of Central Banks (ESCB) as the necessary *quid pro quo* for the surrender of the deutsche mark. A voice opportunities explanation might also emphasize the equal representation of all Euro-Zone central bank governors on the ECB Governing Council as a *sine qua non* in the design of the ECB.

Some neo-realists might now be tempted to insist upon the inherent fragility of the EMU project and the authority of the ECB. When – in the context of prolonged asymmetric shocks that affect the economies of particular Euro-Zone member states more than others – these

member states may come to perceive that their interests diverge excessively from the Euro-Zone mainstream and they may choose to leave the EMU. Neo-realists could also point to the continued divergence in national economic policies, regardless of the convergence criteria of the EMU project and the rules of the Stability and Growth Pact, and the difficulty of forcing member state governments such as Italy and Ireland to respect the criteria (see Appendix 2). The risk remains that member states, for purely domestic political reasons, will adopt economic policies which create inflationary pressures for the other members of the Euro-Zone and thus undermine confidence in the value of the euro and the EMU project more generally.

Neo-realism seeks to avoid theoretical complications by avoiding the use of any concepts from comparative or domestic level politics. The lack of attention to internal domestic dynamics of states raises serious concerns about the comprehensiveness or usefulness of neo-realism to understanding European integration and more specifically EMU. Moreover, neo-realism fails to address adequately the role performed by EU institutions such as the Commission, Parliament and the ECB – as supranational bodies with their own particular interests rather than as fora of intergovernmental relations – in the operation of EMU.

Regarding the move to EMU more generally, most theorists (for example, Sandholtz 1993; Moravcsik 1998; Grieco 1995) discount the geo-political changes in Central and Eastern Europe in 1989/90 as a reason for French and German support for EMU. Geo-political changes are entirely irrelevant if the 2 June 1988 agreement between the West German Chancellor, Helmut Kohl and the French President, François Mitterrand, to push ahead with EMU was truly definitive. However, it is important not to discount the significance of these changes. Baun (1995) demonstrates their importance in keeping the EMU negotiations on track. From the French perspective (Howarth 2001 and 2002a), geo-political changes helped to convince many leading politicians of the necessity of EMU to tie Germany to the EU in order to prevent it from turning to *Mitteleuropa* as its zone of influence. It is impossible to determine whether or not President Mitterrand's resolve on EMU would have been enough to force French acceptance without German reunification. However, it is clear that geo-strategic changes helped him to convince a French political class motivated by *realpolitik* and greatly preoccupied by German power (Garcin 1993). From the German perspective (Loedel 1999a) geopolitical changes encouraged Kohl to overcome strong domestic opposition to EMU and the loss of the deutsche mark, and sacrifice domestic monetary independence in

order to assuage the concerns of the European partners, in particular the French.

Another geo-political motive – challenging American monetary dominance – motivated French support for an expanded European currency from the creation of the ECU – the European Currency Unit, the precursor to the euro – in 1979 (Howarth 2001). In the 1970s, French interest in European monetary cooperation was initially sparked by the collapse of the Bretton Woods System and the inability of the French to convince the Americans to re-establish an International Monetary System (IMS) which maintained stability between the dollar and European currencies. The French and others sought intra-European monetary stability in order to diminish the impact of dollar fluctuations (and American interest rate policy) upon European currencies and economies. These international monetary power motives should be seen in the context of the larger French geo-political goal of diminishing American economic and political hegemony in the international system. The French also wanted to avoid the creation of a tri-polar monetary world between the dollar, the yen and the deutsche mark. They argued that the mark could never compete with the dollar as an international reserve currency whereas the ECU had more potential. This logic of monetary power and the use of the term 'écu' in France – always spelled inaccurately with an accented small 'e': the name of a mediaeval French currency – helped to make the expanded use of the European currency and the creation of a stronger European monetary authority to manage and promote it acceptable even to some of the most nationalist opponents of European integration. EMU and the creation of a single currency can also been seen from this perspective. Permanently fixed European parities ended the speculation created by dollar fluctuations. It is much more difficult to speculate against the euro given its size.

Liberal intergovernmentalism

Liberal intergovernmentalism – a recent incarnation of intergovernmentalism developed most famously by Moravscik (1993, 1998) – claims that state strategies are based upon power considerations and preferences. Power is dependent upon a number of factors which will determine whether bargaining and issue linkage strategies are successful for governments. Preferences are shaped by macroeconomic considerations focusing upon the competitivity of large national companies in the context of global capitalism, rather than the geo-political power considerations of governments emphasized by neo-realists. According to

Moravcsik (1998) EC member states, led by France, sought EMU in order to increase their 'margin of manoeuvre in macroeconomic policy-making'. He (1998: 412) argues that '[t]he central French economic goal – greater macroeconomic flexibility through restraints on the Bundesbank and multilateral financing of central bank intervention – remained the same regardless of whether the forum was regional, bilateral or multilateral'.

A major weakness of liberal intergovernmentalism in explaining the move to EMU concerns the formation of national preferences. Moravcsik places great emphasis on the role of large industrial interests in France and Germany and correctly challenges claims that business support did not exist (1998: 380). However, this should not lead to the conclusion that business interests created the momentum behind the project. In late 1986, former French President Giscard d'Estaing and former German Chancellor Schmidt established the Committee for the Monetary Union of Europe which included government officials, industrialists and bankers (Collingen and Schwarzer 2002). The directors of several large EC corporations also created the Association for Monetary Union in Europe in 1987. Both were established with the aim to lobby governments to support EMU. However, neither actually did very much prior to the Maastricht Summit. Moreover, pro-EMU ideas had been circulating in banking and business circles since 1969. Sandholtz (1993: 24–5) appears to be correct when he argues that the interest group approach fails to explain why these ideas were heard in 1988–91 and not previously (see also Eichengreen and Frieden 2001). In France, François Perigot, the president of the leading employers' peak association, the CNPF (*Conseil national du patronat français*), came out in support of EMU only in April 1989, and the CNPF did not produce any study on the impact of EMU until after the Maastricht Summit. UNICE, the EC-wide employers' association endorsed EMU only in December 1990 (*Agence Europe* 1.12.90, 5382). For large importers and exporters, EMU was seen as less important a development than the Single Market Programme.[3] In most EC countries, business opinion – as well as public opinion more generally – was positive, but not actively so, which gave governments room to manoeuvre on the matter. Policy was led by the political and technocratic elites, not societal actors. Nonetheless, consistently high levels of business support help to explain why the project was kept on track despite numerous negotiating obstacles. This support provided a useful justificatory weapon for those in favour of EMU which could be wielded against those who opposed the project. According to a January

1989 poll, 86 per cent of EC employers supported the EMU goal although the precise design of the project had yet to be determined (*Quotidien de Paris*, 20.1.89). Liberal intergovernmentalists also emphasize that the 'sound money' (low inflation) orientation of the EMU project corresponds to the preferences of most large European companies which approve the constraints imposed on national governments to maintain a stable macro-economic framework which would contribute to a more positive investment climate in most Euro-Zone member states – with lower real rates of interest.

With regard to the operation of the Euro-Zone, intergovernmentalists might emphasize the extent to which ECB policy-making reflects the struggle among NCB governors who, despite their legally guaranteed independence and obligation to consider the interests of the Euro-Zone in general, tend nonetheless to represent the economic and political concerns of their respective member states. Furthermore, the on-going battle for Executive Board positions for member state nationals clearly reflects the belief – whether valid or not – that obtaining these positions increases national influence or, that at the very least, membership should reflect the relative importance of the different member state economies. Thus, perhaps unsurprisingly, five of the first six Executive Board members (including the President) came from the five largest economies of the Euro-Zone. Likewise, the battle over the replacement of Christian Noyer as ECB Vice-President demonstrates the extent to which Executive Board positions are prized. By April 2002, all the member state governments accepted appointment of the qualified governor of the Greek central bank, Lucas Papademos, with the exception of the Belgians, who sought the appointment of the Belgian senator and monetary policy expert, Daniel Gros. The Belgians abstained on the final vote but also made it clear that they would block the appointment of a Frenchman – probably Jean-Claude Trichet – as the ECB President in 2003, if the next appointment to the Executive Board was not a Belgian (*Financial Times*, 13 April 2002). An even clearer example of the perceived importance of the placement of nationals was the fudged appointment of the first ECB President in 1998. President Chirac – in a minority of one opposing the appointment of Wim Duisenberg – insisted that the first ECB president be a French national and forced the highly unusual compromise that Trichet would replace Duisenberg half-way through the latter's eight year term. Chirac insisted upon Noyer's appointment as Vice-President as a compensatory stop-gap measure to ensure France's hold over a leading position prior to Duisenberg's replacement.

(Neo-)functionalism

The central prediction of functionalism and more modern reformulations known as neo-functionalism is that European integration would be self-sustaining. The theoretical basis for this prediction was the concept of 'spill-over', whereby initial steps towards integration trigger endogenous economic and political dynamics leading to further cooperation (Haas 1958; Lindberg and Scheingold 1970). Functionalism suggests two areas for spill-over: functional and political. Functional spill-over occurs when incomplete integration undermines the effectiveness of existing economic policies, thereby creating pressures for deepening and widening policy co-ordination. Political spill-over occurs when the existence of supranational organizations sets in motion a self-reinforcing process of institution-building. The regulation by such supranational institutions and authorities (notably the European Commission) of the integrative and interdependent European economy requires such oversight. Monetary integration seemed well-suited for functionalist theorizing. As Overturf (1997; 161) notes, integration:

> was more administrative than political in nature, with tasks being performed by groups better described as coordinating agencies than political governments. It would correspond best to a smooth running, rational technocracy, with experts coming together to solve international problems of co-ordination in specific task areas for the benefit of all.

Functional and political spill-over in the area of monetary policy was both eased and encouraged by national central bankers who played a crucial role in reinforcing monetary cooperation among EC member states from the 1960s. Without this cooperation the move to EMU and the reinforcement of European monetary authority would likely have been impossible.

Monetary integration also represents a logical economic spill-over from the trade liberalization of the 1992 single market programme (initiated by the 1986 Single European Act (SEA)) and the massive increase in international/intra-EC capital flows. By the mid-1980s, several monetary economists – led by the Italian Tommaso Padoa-Schioppa (1994; 2000) – popularized the neo-functionalist 'inconsistent quartet' or 'triangle of incompatibility'.[4] According to the 'quartet', a state cannot enjoy monetary autonomy, free trade, free capital flows and fixed exchange rates at the same time. One must be surrendered. With the

Single European Act (SEA) of 1986, the EC member states had committed themselves to freer trade and capital flows, while the objective of the EMS was to minimize exchange rate fluctuations, thus facing participating states with the 'inconsistent quartet'. Only the country with the strongest currency (West Germany) retained its monetary autonomy. As a justification for EMU, the 'quartet' also assumed that, even though the operation of the asymmetric EMS left member state policy-makers little room to manoeuvre and that interest rate decisions followed those of the Bundesbank, the liberalization of capital meant that even tighter convergence in the EMS was not enough to ensure stable parities.

Several theorists, including Sandholtz (1993), Grieco (1995), Moravcsik (1998) and Østrup (1995), challenge functionalist claims of spill-over from capital liberalization to EMU.[5] First, they argue that the 1992 process strengthened the logic behind monetary integration but did not make EMU necessary. These authors argue that decisions about EMU took place prior to the removal of capital controls in 1990. In fact, the decision on capital liberalization was made at the same 2 June 1988 Franco-German summit when President Mitterrand and Chancellor Kohl reportedly agreed to proceed with discussions on EMU. There was no necessary spill-over. However, it might be possible to argue that there was a *perception* of necessary spill-over from the SEA to EMU via capital liberalization. Revisionist neo-functionalists place increased emphasis upon the role of ideas and actors: spill-over is not only about what is necessary but what people believe is necessary. In this way, neo-functionalism can be partially salvaged if 1) the decision on capital liberalization was *seen* as absolutely necessary following the SEA and 2) French and other EC policy-makers *anticipated* spill-over when they agreed to accept capital liberalization. EC governments most likely thought that capital liberalization created an economic dynamic encouraging EMU, in addition to it being the German precondition for starting the EMU negotiations. However, it is unlikely that they agreed to start the negotiating process on EMU *because* they accepted the need for capital liberalization and saw a necessary link between the two. Still, neo-functionalism at the level of perception remains a possibility. Moreover, the recognition of EMU as a long-term objective in the SEA encouraged this perception.

Prior to the Maastricht Treaty, political spill-over involved measures to reinforce cooperation among EC central bank governors. The EMU project through the convergence criteria, embodied further spill-over, restricting the economic policy-making of national governments. This

was further reinforced by the Stability Pact, which specified fines for countries which failed to respect the 3 per cent public deficit criterion and forced member state governments to prepare medium term economic guidelines to demonstrate the sustainability of national efforts to maintain low deficits – developments made possible by general provisions in the Maastricht Treaty. In the context of the EMS, economic policy co-ordination among national governments and a degree of economic policy convergence was accepted as a necessary pre-condition for exchange rate stabilization in the ERM. Since the start of the EMU project, the issue of spill-over has been linked closely to the construction of 'economic government' (or 'governance') at the EU level. From the late 1980s, European politicians and economists have disagreed as to the extent to which national economic policies must be harmonized – for example, should there be tax harmonization? – the precise nature of economic policy co-ordination, the profile of the Eurogroup, the rigour with which the Stability Pact fines should be imposed and the relationship between the ECB and other EU institutions. The pressure for further political spill-over has been great, held back by certain member states which seek to retain as much margin of manoeuvre in macroeconomic policy-making as possible despite the constraints of the Single Market and the operation of the Euro-Zone.

Liberal institutionalism/regime theory

Liberal institutionalism – often combined with some form of regime theory – explains the EU, and more specifically EMU, as an international regime. Regimes – defined as the principles, norms, rules, and decision-making procedures around which actor expectations converge on a given issue (Krasner 1983) – can help structure an analysis of the operation of EMU and the role of the ECB. Understanding the regime of European monetary and economic integration involves emphasizing the institutional components of joint-decision-making and the design and enforcement of Euro-Zone rules. Moreover, norms of behaviour can be identified with regard to EMU: the necessity of compromise, the transparency and close co-ordination of economic policy and a careful public discourse to avoid undermining the credibility of EMU.

Thus liberal institutionalism emphasizes the importance attached to the role of institutions and norms in the process of European integration. This approach suggests that institutions 'matter' (Keohane 1989) by affecting the interests of member states and mitigating the relative gains of states (Baldwin 1993). Joint or absolute gains from agreements, the development of long term relationships engendering trust among

actors, and expectations of reciprocal behaviour can be achieved through the development of common interests built on institutions. Such approaches also highlight the importance of domestic politics to understanding how choices and preferences are constructed and how common interests can be identified. In short, EU decision-making institutions and the norms and expectations of behaviour within the EU, have produced a sustained pattern of cooperation and integration based on the choices and preferences of state actors.

Liberal institutionalist theory (for example, Axelrod (1984) and Keohane (1984)) would explain the design of EMU in terms of the 'constitutionalisation' of 'sound money' ideas in participating member states through the convergence criteria, the principle of independent central banks and the primary goal of the ECB: the pursuit of price stability. A 'stabilization' regime is created at the EU level in which the ECB plays a core role as policeman. If individual Euro-Zone member states fail to pursue policies that contribute to price stability in the Euro-Zone, the ECB can criticize them publicly (while the Commission can recommend that the Eurogroup do so). Most importantly, the ECB possesses its interest rate weapon to encourage member states to modify their economic polices, to ensure the maintenance of low inflation. However, the ECB must seek to perform its policeman role in an unobtrusive manner which does not damage its relationship with the member states and seek to build a good relationship with them in its presence in the Economics and Financial Committee (with EU treasury and central bank officials), at Eurogroup meetings (with Euro-Zone ministers of finance) and in international fora. Liberal institutionalists examine the current development of EMU in terms of these pre-existing norms: the development of economic policy co-ordination at the European level, the macroeconomic policies adopted in the participating member states, the role of the ECB in relation to political authorities (the Eurogroup, the Commission and the European Parliament) and the ECB's own policy-making are all seen in terms of how they reinforce or undermine the stabilization goals of EMU, the credibility of ECB monetary policy-making and even the legitimacy of the stabilization goals and ECB control. The role of the ECB in the 'international regime' of EMU is discussed further in Chapters 4 (organization and powers) and 5 (legitimacy and accountability). Some member state governments – notably the French – have sought to challenge the norms underpinning EMU and the role of the ECB. France's position on the need to qualify both the stabilization bias of the EMU project and the central bank independence and convergence rules

which ensure this bias is explored in the chapter on national perspectives.

Structural changes in global capitalism

Dyson *et al*. (1995), amongst others, argue that EMU and the creation of an independent ESCB should be seen in terms of national central bankers seeking to reassert their control in the context of major structural changes in the global economy which weakened their policy autonomy during the two decades prior to EMU. Thus the interests of central bankers as actors are of explanatory importance – as argued by some applications of rational/public choice theories (see below) – but only secondary as they have been very much shaped, and their influence very much determined, by larger structural factors. Referring to Moran (1991), Dyson *et al*. (1995: 473) argue that the proliferation of institutional investors (particularly from overseas) weakened European central bankers because it undermined their traditional social and cultural cohesion ('cosy networks') with narrow and exclusive domestic financial communities. Furthermore, the rapid increase in international capital flows overwhelmed national capital controls and the domestic reserves that national central bankers could wield in managing exchange rate policies within the ERM, and considerably weakened the effectiveness of traditional monetary targeting (O'Brien 1992 and Porter 1993). In the EMS, the 'inconsistent quartet'/'triangle of incompatibility' set in: participating treasuries and central banks gradually lost their monetary policy autonomy as they sought to limit exchange rate fluctuations, while following Bundesbank interest rate decisions, in the context of increasing financial integration. However, at the same time, the need for increased co-ordination within the EMS and the need to follow the German lead on price stability increased the power of participating central banks in relation to treasuries and governments and increased the importance of price and exchange rate stability and credibility building. The influence of central bankers was reinforced by the market penalties – thus structural factors – imposed on countries that inadequately toed the line. Market penalties helped reinforce convergence towards 'sound money' and support for central bank independence, which could be presented as a low-cost reform to combating the high inflation of the 1970s and 1980s. Globalization and the deregulation of the financial markets increased convergence in national financial structures in West European countries, which contributed to the acceptability of monetary integration. Central bankers also argued that influence over monetary policy could be regained

from the financial markets by acting collectively, creating a single European currency managed by a credible independent European central bank.

Comparative political science approaches

Historical institutionalism and epistemic communities

Liberal institutionalism is mirrored in comparative political science by historical institutionalism, which emphasizes path dependency in the construction of EMU: that is, the determination of institutional and policy-making outcomes by the sequence of decisions made over time (Pierson 1996). A path dependency approach to understand the operation of ECB monetary policy since 1999 would emphasize the rules established in the Treaty on European Union and reinforced by subsequent decisions which ensure the continued pursuit of low inflationary policies (Campanella 1995). Policies are thus not the result of ideas, *per se*, or the calculation of the interests of individual members of the ECB Governing Council. Moreover, path dependency leads to the continuity of policy-making which is unlikely to change given the risks this would pose to the credibility of the ECB.

Those academics who emphasize the role of 'transgovernmental relations' in the creation of the EMU project argue that the officials with most influence over monetary policy – notably, central bankers and treasury officials – had become used to working with each other and shared more in common than with their respective national colleagues. The fora for this cooperation were the meetings of EMS central bank governors following those of the International Bank for Settlements in Basle, ECOFIN (ministers of finance), the EC Monetary Committee (becoming the Economics and Financial Committee in 1999, consisting of treasury and central bank officials) and from 1987 the Franco-German economic council (treasury and central bank officials from the two countries). Verdun (1998b and 1999) examines the role of the central bank governors in these various fora as well as the Delors Committee as an 'epistemic community'.[6]

The following chapter of this volume examines the history of European monetary authority in terms of the construction of a powerful epistemic community. The fora listed above were not only additional mechanisms for intergovernmental bargaining (see Rosenthal 1975) but also involved policy learning and socialization which were an important driving force for improved policy co-ordination and monetary integration. Given the central importance of the

governors to the success of the EMU negotiations, this would also suggest the importance of this epistemic community to understanding the process leading to the Maastricht Summit. (Verdun (1999) lists four ways – discussed *inter alia* in the next chapter – in which the Delors Committee played an important role in the EMU negotiation process). Applying a structuralist approach (see below) Dyson *et al*. (1995) argue that the development of financial markets into the 1980s facilitated the growing dominance of the monetary experts, who set the agenda of acceptable monetary policy-making and monetary cooperation which governments accepted. Their success owed to their uniform insistence on coherent ideas about monetary policy (low inflation and currency stability). Any government that opted to deviate from these goals faced the sanction of the financial markets which could undermine the stability of the national currency. Verdun (1998b: 190) argues that the integration process could only move forward if conducted along the lines of what monetary authorities had decided as the common line. The interests of the various national monetary authorities were not completely dissimilar from their national governments (as monetary authorities also included finance ministers), but they did not simply fight over perceived 'national' interests. Nor did they come up with a 'lowest common denominator' solution as neo-realists predict which would have been the case with intergovernmental bargaining. The process of policy learning and socialization moulded these monetary authorities. Working within a European institutional framework, they began to look at their interests somewhat differently and sought acceptable European solutions to the problems.

It should be noted that some scholars question the usefulness of the epistemic community approach to explain the move to EMU. Dyson (1994) for one questions the importance of an epistemic community to the spread of 'sound money' ideas across several countries, concluding that this approach to policy-making fails to explain the decision by key member state governments to support the EMU project. Rather 'the national basis for economic policy ideas remained solidly entrenched' (1994: 251). Other scholars focus upon the importance of a domestically based epistemic community which helped to enforce 'sound money' attitudes in several EC member states which in turn made it possible for governments to accept the imposition of the German standard on inflation, the EMU project and specifically the appropriate model for central banks.[7]

The debatable importance of an epistemic community in the move to EMU also raises the problem that the major building blocks of EMU –

'sound money', neo-liberal reform and the independent ECB – were all pursued at an elite level. Prior to the December 1991 Maastricht Summit, these issues were not the subject of widespread political debate or interest group mobilization. In this sense, the move to EMU and its institutional design correspond to much of European integration which is marked by elite driven developments and technocratic policy-making rather than efforts to galvanize democratic participation. McNamara (1998: 174) also points out that 'all this could change … for EMU both exacerbates and makes visible what was previously obscured, that is, the social costs of neo-liberal reforms and the democratic deficit inherent in European integration more generally'. Thus the influence of central bankers in the lead up to EMU and the reinforcement of their power in the Maastricht project point to concerns regarding the democratic deficit which are discussed in Chapter 5.

The cognitivist approach: the importance of 'sound money' ideas

The prevalence of 'sound money' ideas made EMU possible (Dyson 1994; McNamara 1998; Sandholtz 1993; Verdun 1996; 2000b), notably because the acceptance of these ideas enabled the French and other member state governments to accept the institutional design – independent central banks – and rules that entrenched 'sound money' – the convergence criteria and the primacy of price stability – whereas prior to the 1980s most were not willing to do so. Lessons of policy failure in France and other countries (Howarth 2001), the ill-effects of macro-economic and monetary policies that resulted in relatively high inflation, increased the attraction of 'sound money'. Likewise, policy-learning from the success of the German model of independent central banking encouraged governments to accept independence as the best way to reinforce the credibility for tackling inflation and the need to transpose the German model to the European level. 'Sound money' has been embedded in a competitive neo-liberal policy consensus 'based on a pragmatic version of monetarist theory, one that advocates a monetarist emphasis on price stability while departing from monetarism in advocating fixed exchange rates' (McNamara 1998: 173). 'Sound money' is rooted in the rise of neo-classical economics which upholds the neutrality of monetary policy in the long run, the view that the reduction of unemployment depends principally upon supply-side policies and the importance of agents' expectations and thus credibility building for the effectiveness of monetary policy. As the principal measure for building credibility, neo-classical economics advocates the isolation of monetary policy from political influence – which risks sacrificing 'sound money' for other short-term political and

economic goals – and independent central banks with the legal obligation to pursue price stability.

Neo-liberal views were shared by the economists working on the Commission's *One Market, One Money* study of EMU. The first ECB president, Wim Duisenberg is a monetarist who has long been known for his emphasis on monetary rigour as Dutch central bank governor. Verdun (1996) looks at how the rise in popularity of neo-liberalism in the 1980s proved conducive to monetarist policy-making, while Gill (1997) shows the strength of neo-liberal ideas in EC institutions, as does Hall (1986) in other international organizations. The economic slow-down and rise in unemployment in the early to mid-1990s in several West European economies, and the demands – coming principally from French governments – for a greater 'balance' in EU economic policies (see Chapter 3) have only moderately threatened the existing consensus. If the move to EMU relied upon the neo-liberal consensus, the successful operation of the Euro-Zone will rely upon the continuation of this consensus.

Marcussen (1998, 2000) examines the important role of three ideational mechanisms in the development of support for central bank independence: central bankers as 'ideational entrepreneurs', Germany as the ideational model and – an idea introduced by DiMaggio and Powell (1991) – ideational coercion. Marcussen seeks to explain why the EU member states not participating in EMU – Britain, Denmark and Sweden – all, nonetheless, opted for central bank independence, even though this was contrary to their monetary policy-making traditions, and why the French chose to do so right at the start of Stage Two of EMU in 1994 rather than wait until 1998. His core argument, however, can be applied to several of the other EU member states and helps to explain the logic behind the independence of the ECB. Marcussen (2000: 23) argues that much of the pressure behind reform was neither economic nor legal but was rather ideational: 'once a causal idea about the positive relationship between central bank independence and low inflation performance has become safely institutionalized in formal treaties, it starts to become difficult to avoid its constraining impact because any deviance from this norm will be considered to be illegitimate'. Ideational coercion – indeed a form of 'peer pressure' – played a role in that if reform was not undertaken, the national policy elites risked being excluded from the EU policy elite. Finally, a cognitivist approach to ECB monetary policy-making since 1999 would insist upon the continued importance of sound money ideas and the peer pressure of central bankers which would have much

greater influence over interest rate decisions than national bias. However, unlike path dependency approaches, a cognitivist approach would also accept the possibility of ideational shift in the central banking community and the influence of ideas about effective monetary policy coming from international organizations and academic communities. While the Treaty on European Union mandates the ECB to maintain low inflation, the bank's Governing Council retains the power to determine its own inflation target.

Other theories of central bank behaviour

Before proceeding to structural explanations of EMU and the ECB, we should also mention a couple of the traditional theories of central bank behaviour which fit uneasily into the three categories of comparative political theory (see Dyson *et al*. 1995: 476). Public-interest theories assume some broad consensus amongst central bankers and economists as to what is 'appropriate' policy and thus can be linked to ideational explanations. Public-interest theories attempt to explain the behaviour of central bankers as an exercise in applied welfare economics: avoiding inflation and stabilizing financial markets in the interests of the population (as opposed to the selfish, short-term behaviour of politicians and market operators).[8] Personality theories focus on the influence of important individual central bank governors (Boyle 1967; Friedman and Schwartz 1963: 411). It is clear, that the most powerful central banker of the period during which the discussions and negotiations on EMU took place, Bundesbank President Karl Otto Pöhl was a more conciliatory president than either his immediate predecessors or his immediate successor. Likewise, Pöhl's French counterpart, de Larosière, enjoyed considerable prestige as the former head of the International Monetary Fund (IMF). However, personality theories fail to demonstrate any correlation between the start of negotiations and the arrival of new influential central bank governors or their relations with powerful political figures. The press coverage of the ECB since the start of EMU and the drop in the value of the euro has frequently – but problematically – turned to commentary on the ECB president, Wim Duisenberg's, managerial and communications competence, and has even occasionally entered into the realm of personality analysis.

Structuralist explanations

In addition to changes in global capitalism, Dyson *et al*. (1995: 479–81) point to three structural factors that help to explain the influence of central bankers in relation to governments in the 1980s and the struc-

ture of the ESCB agreed upon by member state governments. First, the Bundesbank both had a great deal of influence in the EMU discussions and became the model for the future ECB principally because of its impressive and long-standing record fighting inflation, and the role of the deutsche mark as the most credible EU currency and the ERM's anchor. The Bundesbank also enjoyed a domestic support base and legitimacy denied most other central banks. This enabled the Bundesbank to insist upon the 'economist's' approach to EMU, which involved gradualism, economic convergence and the indivisibility of monetary policy (Smaghi *et al.* 1994). A second structural factor was the powerful position of leading national central bankers in relation to national governments and national bureaucracies. The power of bankers was due either to a tradition of distance and respect (as in Germany and Italy) or close ties and elite networks in the operation of policy (as in Britain and France). Their influence ensured the success of EC central bankers in dominating the formulation of the ESCB's institutional design.

A third structural factor was the limited resources that the EC had at its disposal. The European Commission and other EC institutions were thus relatively weak in relation central bankers during the discussions and negotiations on the ESCB design. Modest EC resources also ensured the unbalanced institutional organization of EMU in favour of the ECB and monetary policy, with the limited construction of the economic policy side of EMU and a political counterweight ('economic government') with which the ECB could enter into dialogue. The small size of the EC budget dictated the construction of EMU which focused on the rules-based approach of monetary policy involving the convergence criteria, a ban on 'bail-outs' for governments, and the development of monetary instruments to achieve price stability. Furthermore, Dyson *et al.* (1995: 480) argue that the in-built regulatory approach of the EC to policy (see Dehousse 1992; Majone 1996, 1999) placed the burden of work for developing EMU on to the Committee of Central Bank Governors and, from 1994, the European Monetary Institute (EMI), where the central bankers designed a project to their liking.

Rational/public choice theories

Some rational/public choice theories of central bank independence which emphasize the aims of politicians seem to have some potential validity, especially given the centrality of political actors in the decision to move to EMU. These include scapegoat theories (Kane

1980) which emphasize the desire of national governments to pass on monetary policy to independent central banks so that blame for policy failures can also be shifted. Another variation on rational choice places emphasis on the desire to eliminate the domestic political difficulties associated with exchange rate adjustments (Bean 1992; Østrup 1995). According to this approach, EMU became necessary when – in the context of liberalized capital flows – the EMS demonstrated its failure to maintain stability despite considerable economic convergence. March's (1986) 'garbage can' model of policy-making applies: national governments sought to transfer responsibility in a policy area that had become too politically difficult to manage. This claim has a certain intuitive appeal: none of those countries most in favour of EMU in the late 1980s – France, Italy, Spain and Belgium – had distinguished themselves over the previous decades by their exchange rate policy successes.

The application of a rational choice approach to weak currency country policies on European monetary *cooperation* – notably the creation of the EMS – makes sense. As these countries (France, Italy, etc.) tended to suffer from speculation, and devaluations were normally perceived to be a sign of managerial inadequacy, governments had a certain political interest in constraining their margin of manoeuvre in economic and monetary policy-making within European exchange rate mechanisms in order to ensure greater monetary stability. However, in the French case at least, the application of the 'garbage can' model to policy-making on EMU and the decision to transfer powers to an independent Bank of France and the ECB is problematic. French policy-makers did seek to transfer control over monetary policy to European institutions because it was politically difficult to manage. However, they blamed this difficulty upon the asymmetric functioning of the ERM in the context of increased capital mobility – which considerably narrowed their margin of manoeuvre in monetary policy-making – not upon their control *per se*. Indeed, the French sought to maximize their *de facto* control as much as possible through the creation of a more symmetric EMS (Howarth 2001).

Opposition to central bank independence was well-entrenched in several EC member states, including the most influential country in favour of EMU: France. Despite ideational pressures pushing in the direction of independence and a relatively recent record of devaluations, in the late 1980s few French politicians and officials in the powerful Treasury division of the Ministry of Finance which con-

trolled monetary policy, considered independence to be either desirable or necessary to enhance the credibility of French policy-making (Howarth 2001; see also the section on France in Chapter 3). Politicians thus did not transfer monetary policy because they felt that it was too politically difficult to manage. Rather, President Mitterrand accepted – in the face of considerable domestic opposition – German conditions on the institutional design of EMU regardless French policy-making tradition. The opposition of most leading French politicians to central bank independence and the attempt to establish a powerful political counterweight to the ECB at the European level, indicates their preference to maintain *as much* political control over monetary policy-making as possible.[9] What the French sought to end were, first and foremost, the politically embarrassing difficulties and economic costs involved in dealing with speculative attacks against the franc, not their *de jure* control over monetary policy. Mitterrand agreed to surrender control over most aspects of monetary policy to an independent Bank of France and ECB *only* when further EMS reform to create a more symmetric system proved highly unlikely and when the Germans refused to modify their position on independence. French efforts to qualify ECB independence since the Maastricht Treaty further demonstrate the problematic nature of claims of 'garbage can' policy-making. Thus the application of a rational choice model to explain the logic behind the support of national policymakers for the transfer of monetary policy-making power to an independent ECB appears problematic. Nonetheless, the attacks by some national governments on the ECB for its policy-making – explored in Chapter 6 – suggest that claims of scapegoating appear to have some limited validity.

The application of public choice theory to the behaviour of national central bankers (including their choice of monetary instruments and how to use them) focuses on how they are driven by the private self-interests of central bankers acting as rational maximizers seeking their own prestige and self-preservation (Toma and Toma 1986). Public choice theory clearly fails to explain the timing of the move to EMU and central bank independence in that central bankers were compelled – in some cases reluctantly – to act by politicians. However, the theory can provide useful explanations (in terms of control maximization) of the strong influence of EC/Euro-Zone central bankers in the discussions and negotiations leading to the agreements on EMU, the role of the EMI in the preparations for the start of EMU, as well as the operation of the ECB in the Euro-Zone.

Campanella (2000) and Elgie (2001) convincingly draw on versions of rational choice theory in order to explore the inter-institutional dynamics of European monetary policy-making in terms of a principal–agent relationship (see Calvert, McCubbins and Weingast 1989 and Pollack 1997): the ECOFIN/Eurogroup (member state governments) as the principal and the ECB as the agent. Campanella (*ibid*.) applies a version of game theory – a variation on the strategic interaction approach (Fratianni and Hagen 1990) – to explain the conflict between the ECB and ECOFIN in the 1998–99 period and the likelihood of continued conflict: 'The strategic interaction approach would predict the emergence of a battle for political dominance, where the fiscal authorities are likely to want the bank to subscribe to their own preferences, while the bank resists these pressures [asserts its independence] and sticks to its own prerogatives' (Campanella *ibid*.: 111). However, Campanella argues that the triangular relationship of principal–agent and a third actor, namely the market constituency, to which the agent (the ECB) is accountable, establishes what she labels – drawing on Axelrod (1984) – an 'iterated strategic interaction'. A standard game-theoretic approach – a one-time game of chicken – does not apply.

> [The actors] belong to the same EMU environment, and are expected to play this game over and over again. This signals that they are bound sooner or later to learn to calculate, before any move is made, the likely consequences of the other group's move on its own payoff. … [ECOFIN/the Eurogroup] must recognize the ECB's motives in resisting political pressures. … This iterated game also explains why the ECB does not always engage in bitter confrontation with [ECOFIN/the Eurogroup]. Indeed, when direct governmental pressures are removed, the bank will eventually review its resistance, settling for an accommodation with political authorities (Campanella 2000: 112).

The details of this triangular inter-institutional relationship are further explored in Chapter 6 of this volume.

Elgie (2001) applies principal–agent theory to understand better the nature of the democratic deficit created by the ECB's control over European monetary policy. First, the theory can be applied to demonstrate that the agent (the ECB) is 'shirking' from the delegation of power as set up by the principal (the member states collectively) in the TEU – principally by insufficiently taking into consideration its

secondary goals of supporting the economic policies of the Euro-Zone member state governments – and thus acting in an undemocratic manner. Second, the principal–agent theory can also be applied to explain the underlying logic of criticism of the ECB along the lines that the preferences of the principal have changed since the Maastricht Summit – notably in terms of French government demands for an 'economic government' – thus resulting in a divergence with the preferences of the ECB. Elgie also applies the agent–principal theory to demonstrate ways to diminish the deficit – what he labels as standard and non-standard solutions – in the event that it is deemed to be unacceptable. This application is further explored in the final chapter of this volume.

Rational choice theories can also be applied to explain and attempt to resolve the free-rider problem. In the context of EMU, the risk is strong that individual member states will, for domestic political reasons, not obey the rules of the Stability and Growth Pact and run excessive public spending deficits and/or permit excessive inflation. Although there are penalties – fines can be imposed on countries that fail to respect the deficit criterion – many observers believe that these would not be imposed for political reasons. The February 2002 decision of the Eurogroup not to sanction officially Germany and Portugal for running deficits approaching the 3 per cent figure – as recommended by the European Commission and the ECB – provides a good example. The other Euro-Zone member states would thus pay the price of higher ECB interest rates. This has implications for the ECB which plays the delicate role of policeman, delivering its very public warning to recalcitrant member states, as well as judge, delivering its verdict through its interest rate weapon.

Finally, a rational choice approach – focusing upon cost and benefit incentive structures – can be applied to the decision-making process of the ECB itself. According to this approach, the individual members of the ECB's Governing Council have potentially divided loyalties. NCB governors sitting on the Governing Council are, according to the mandate of the ECB, expected to consider the interests of the entire Euro-Zone when they make policy proposals. However, the governors, while officially independent from political influence at the national level, are prone to represent the economic interests of their own member state. Thus ECB monetary policy-making should – according to this approach – be seen as a reflection of a balance among the differing perspectives of the NCB governors competing to shape policy in a way most suited to the needs of their national economies and even political circumstances.

Conclusion

Several of the theoretical perspectives drawn from comparative politics emphasize the important role of central bankers in the move to EMU and the determination of its rules and institutional design: in historical institutionalist, cognitivist, structural and rational choice terms. However, it is important to note that, although the central bankers clearly played an important role, politicians played *the* crucial role in the move to EMU. Politicians initiated the project and overcame the caution of the central bankers as demonstrated most clearly in the bankers' view that the need for previous economic convergence meant that there should be no fixed dates for stages two and three of the project (Delors 1989: 28). Had the central bankers had their way, EMU may never have come about. Moreover, the bankers failed to convince EC governments of the need for an independent EMI in Stage Two – due principally to German refusal. Nonetheless, despite the clear limits to the influence of central bankers in designing the transition, the EMU project corresponded very much to their preferences: with the convergence criteria, including strictly interpreted rules on deficits, the abolition of government bail-outs, the absence of a counterbalancing EU-level macroeconomic policy ('economic government') and, above all, central bank independence.

In order to appreciate the contribution of different theoretical approaches from international relations and comparative politics to understanding the creation and operation of EMU and the ECB, this chapter has embraced the eclecticism adopted by Sandholtz (1993) in his study of the move to EMU. We argue that only a combination of different theoretical and analytical approaches provides a thorough explanation of the creation of the ECB, but also that the tools of comparative politics are more useful to our study of the operation of the ECB than those of international relations. The creation and operational principles of the ECB must be understood in structural and ideational terms – the development of global and European capitalism and the proliferation of 'sound money' ideas in particular – while the motives of the most powerful member states and central bankers – themselves structured by EC institutions, the operation of the EMS and increasing international economic interdependence – should also be taken into consideration. Chapter 2 examines the history of European monetary authority in terms of the development of an 'epistemic community', while 'cognitive' factors inspire our study of national perspectives on the ECB and central bank independence (Chapter 3). The role of the ECB in the 'international

regime' of EMU is explored in Chapters 4 (organization and powers) and 5 (legitimacy and accountability issues), while theories of comparative politics, notably rational choice, inspire much of our analysis of the ECB in operation (Chapter 6).

The Long and Winding Road to the ECB: European Monetary Authority in the Prehistory of EMU

Table 2.1 Chronological development of European monetary authority

Date	*Event*
1964	First regular meetings of the Committee of Governors of the Central Banks of EEC member states.
1970	(October) The Werner Report recommends the creation of an ECB and an EC organization of national central banks.
1973	Creation of the European Monetary Cooperation Fund (EMCF / FECOM).
1979	Creation of European Monetary System (EMS) which involves the possible creation of a European Monetary Fund (EMF).
1987	(September) Basle-Nyborg Agreements reinforce inter-NCB coordination and increase EMS support mechanisms.
1988	(26 February) Genscher, the West German Minister of Foreign Affairs, submits a memorandum on the creation of the ESCB including an independent ECB.
1989	(April) Submission of the Report of the Delors Committee recommending the institutional design for EMU including the ESCB and an independent ECB.
1990	(July) Start of Stage One of the EMU project, Committee of central bank governors given additional responsibilities.
1990	At the October Rome (I) European Council, the Heads of State or Government agree to the principle of independent European central banks.
1991	At the December Maastricht European Council, the Heads of State or Government agree to a timetable and conditions for the move to EMU, the creation and powers of the EMI and of the ECB.
1993	(August) The EC ministers of finance agree to widen the fluctuation margins of the ERM to ±15% resulting in a dramatic shift in the co-ordination activities of the Committee of Governors / EMI.
1993	(October) At the extraordinary Brussels European Council, the Heads of State or Government agree to place the EMI (and future ECB) in Frankfurt.
1994	(1 January) Start of Stage Two of EMU. Replacement of the Committee of Governors by the EMI.

Table 2.1 Chronological development of European monetary authority

Date	*Event*
1995	(December) The European Council meeting in Madrid adopts the 'changeover scenario' to the single currency drafted by the EMI.
1998	(March) EMI publishes its *Convergence Report*, recommending that all those member states wanting to proceed with EMU were in a position to do so, with the exception of Greece.
1998	(2 May) On the basis of March 1998 EMI Convergence report and Commission recommendations, agreement by the European Council on the member states to participate in Stage Three of EMU.
1998	(25 May) Compromise in the European Council on the members of ECB Executive Board.
1998	(1 June) Creation of the European Central Bank. Start of term of Executive Board (end of EMI).
1998	(December) Agreement at Vienna European Council to allow ECB President to attend G7 meetings and grant the ECB observer status at the IMF board.
1999	(1 January) Start of Stage Three of EMU. ECB starts to manage the euro.

Introduction

The ECB has had a relatively short history (discussed in Chapter 6) but its antecedents, the Committee of Governors of the Central Banks of the EEC and the European Monetary Institute (EMI) played an important role in the management and development of European monetary policy from the early days of European monetary cooperation to the move to EMU. The history of European monetary authority is, of course, tightly intertwined with the history of monetary integration. Nonetheless, this chapter will not enter into the details regarding the progress of the discussions and negotiations on monetary integration. Readers should refer to the numerous studies of the move to EMU written by political scientists and historians (including, most notably, Dyson 1994; Ludlow 1982; Tsoukalis 1977) and economists and central bankers (including ECB Executive Board member Padoa-Schioppa 1994, 2000; Grahl 1997; Gros and Thygesen 1992, 1998; Kenen 1995; Steinherr 1994; Ungerer 1997). This chapter focuses on the role of EC/EU central bankers in the development of European monetary cooperation and integration. It also examines the debates since the late 1960s regarding the responsibilities of the central bankers in the context of monetary cooperation and more specifically, the responsibilities and powers of a

European monetary authority in the transition period leading to EMU and the design of the ESCB.

The early years of central bank cooperation

EEC central bank governors – notably in the Delors Committee but also in the EMI of the second stage of the EMU project – formed part of an 'epistemic community' which provided the intellectual and institutional backing to the underlying principles of EMU (sound money and finance and central bank independence) (Dyson 1994; Verdun 1999, 2000a).[10] This 'epistemic community' was long in the making. The Managing Board of the European Payments Union (EPU) (established in 1950 and ended in 1958) included central bank governors and national finance ministry officials, who also met regularly at IMF and Organization of European Economic Cooperation/Organization of Economic Cooperation and Development (OEEC/OECD) meetings. The EPU was the most efficient vehicle for West European economic policy co-ordination until the mid-1980s due principally to the temporary payments situation existing in the postwar period. The 1957 Treaty of Rome included provisions for the creation of the Monetary Committee, which comprised one representative from the ministry of finance and one from the central bank of each member state in addition to two representatives from the Commission. This group was to provide a forum for exchange of information and for preparing the meetings of the Council of Ministers of Economics and Finance (ECOFIN). Subsequently, it played a crucial role in the management of European monetary mechanisms (the Snake and the Exchange Rate Mechanism (ERM) of the European Monetary System (EMS)) in particular with regard to co-ordinating system realignments. EEC central bankers also met regularly in international fora, notably the Bank for International Settlements (BIS) (consisting of central bank governors from the Group of Ten).

In 1964, Ecofin mandated the EEC central bankers to meet separately in the Committee of Governors of the Central Banks of the EEC following monthly BIS meetings in Basle. A Commission representative attended Committee meetings as an observer. The Committee's mandate was limited principally to the exchange of information and the resolution of technical issues of mutual concern. The Committee of Governors was one of a series of economic policy committees to develop economic policy co-ordination among the EC Six, to help ensure the smooth operation of the

Common Market. However, it lacked an operational role until the 1970s. In March 1975, the Committee decided – during a period of dollar weakness and volatility – to limit, on an experimental basis, the daily movements in the dollar rates of all EC currencies (not just the Snake currencies). However, this agreement was widely ignored and was not subsequently invoked. In March 1977, the Ecofin Council encouraged the Committee of Governors and the Monetary Committee to extend their consultations on exchange-rate matters. From the summer of 1977, these consultations were aided by the European Commission which submitted at regular intervals analytical papers on recent trends and prospects in exchange markets. The central bank governors also played an important role in both their Committee and the Monetary Committee transforming the often ambiguous Bremen European Council conclusions on the EMS into a workable system.

The idea of a European central bank pre-dates the discussions of the early 1970s in the Werner Committee. In October 1949, the Planning Group of the European Cooperation Administration of the European Recovery Programme presented a timetable for a European monetary union and European central bank, modelled on the American Federal Reserve, as a means to encourage European integration and trade liberalization. The Americans dropped the idea of monetary union when it became clear that several European governments, notably the British, found the resulting loss of sovereignty unacceptable. EMU was not an explicit goal in the Treaty of Rome of 1957 and only limited monetary co-ordination was called for through the EEC Monetary Committee. This Committee and its senior national finance and central bank officials actively called for closer co-ordination of monetary policies, notably to avoid unilateral revaluations. This encouraged the Commission to propose its 1962 *Action Programme for the Second Stage* which involved the creation of a Committee of Central Bank Governors which would manage a system of fixed exchange rates and a European reserve currency, en route to monetary union. French reluctance blocked the implementation of the Programme. However, its publication did stimulate discussions between national ministers of finance – also concerned about the effect of currency instability on the CAP – which led to the agreement on the need for consultations within the Monetary Committee prior to any currency revaluation; an agreement subsequently ignored. Moreover, the ministers of finance created the Committee of Central Bank Governors. The Barre Plan of 1969 was less ambitious than the *Action Programme* and focused on

improving monetary cooperation, including the creation of a Community mechanism of monetary cooperation which would be managed by the Committee of Governors. The discussions surrounding the Barre Plan led to a July 1969 Ecofin agreement on prior consultation on all economic policy measures that would have effect on other member states, including monetary policy decisions. However, the unilateral float and revaluation of the deutsche mark in August 1969 demonstrated yet again the weakness of such agreements. The growing instability in the Bretton Woods System and its perceived damaging impact on the operation of the Common Agricultural Policy (CAP) encouraged further discussions.

The Werner Committee and the European Monetary Cooperation Fund

The EC Heads of State or Government meeting in the Hague in December 1969 affirmed the desire to move forward to EMU. Unlike the Delors Committee of 1988–89 which consisted principally of central bank governors, the Werner Committee – set up in March 1970 to examine the practical steps to EMU – comprised only one central banker, the chairman of the Committee of Governors (in addition to the chairmen of the Monetary Committee and other EC economic policy committees, a representative of the Commission, and the chair Pierre Werner, the Luxembourg Prime Minister). The October 1970 Werner Report recommended the creation of an ECB and an EC organisation of national central banks, based on the US Federal Reserve System, which would conduct the principal elements of internal monetary policy and exchange-rate policy in relation to third countries. However, the Report makes only a relatively brief reference to the necessary institutional framework and was vague as to its establishment and its relationship to political authorities. The Werner Committee's proposals on the move to EMU failed because of the fundamental divergence between the 'economists' (led by the Germans) and 'monetarists' (led by the French). The former saw institutional construction and the establishment of a 'single' currency as following after a necessary economic convergence. The latter saw a 'single' currency and monetary institutions as an initial step required to help achieve economic policy convergence (Tsoukalis 1977). Most members of the French neo-Gaullist government also saw the loss of sovereignty as unacceptable and French President Pompidou, who had first called for EMU, was forced to retreat to a more negative position. At the same

time, many Germans saw the transfer of monetary power from the Bundesbank and the eventual loss of the mark – both important symbols of postwar German economic prosperity – as equally unacceptable. The immediate French concern in the EMU discussions was to improve European support mechanisms to support weaker currencies (notably the French franc) and maintain stability in inter-European parities.

The creation of the European Monetary Cooperation Fund (EMCF/FECOM, the Fund's French acronym) in April 1973 was the major institutional legacy of the EMU discussions. The Fund – legally based temporarily in Luxembourg – was responsible for monitoring the 'Community's exchange rate system', even though only five of the nine EC member states participated in the Snake. Each EC member state governor on the Fund's governing board had one vote. It was expected to provide the central bank governors their first substantive collective task since the European Payments Union (EPU) of the late 1940s: the management of a small percentage of European reserves pooled to help maintain stability in the balance of payments of countries participating in the Snake monetary mechanism established in April 1971. The Fund assumed responsibility for the existing currency support mechanisms (very-short-term and short-term facilities) – which had been developed through agreements by the central bank governors during the EMU negotiations – although the BIS was appointed the executing agent. It should be stressed that there was little substance to these agreements and the creation of the EMCF was of little actual significance to the operation of European monetary policy co-ordination: the Fund's board met formally for a few minutes each month after the Committee of Governors meeting where all the important issues were discussed. The Fund employed no one. Moreover, the separate central banks continued to hold and manage, on behalf of the EMCF, the pooled reserves and receive interest on them, which effectively limited the role of the EMCF to that of a bookkeeper. This limited role was due in part to the Fund's formal subordination to ECOFIN. The EC ministers of finance had rejected the Werner Committee's proposal that the Committee of Governors control the Fund. Several bank governors – notably the president of the independent Bundesbank – found this political yolk unacceptable and insisted that the substantive work on monetary policy co-ordination remain in their Committee.[11] This issue of autonomy would reappear in subsequent discussions on the reinforcement of the Fund.

Reinforced monetary co-ordination

A second product of the EMU discussions of the early 1970s were new provisions for reinforced short-term economic policy co-ordination, including monetary co-ordination (22 March 1971 ECOFIN Decisions). The Committee of Governors was asked to establish general – non-binding – guidelines for the trend of bank liquidity, the terms for supply of credit and the level of interest rates. However, no policy co-ordination resulted beyond the day-to-day concertation in the foreign exchange market. The Committee of Governors established a Committee of Alternates and expert groups, with small staffs, to monitor exchange market developments and trends in national money supplies and their determinants. The Committee also established (with the Monetary Committee) a Working Group on harmonization of Monetary Policy Instruments to follow up on the March 1971 decision. However, this group failed to contribute significantly to improved co-ordination: it only published a series of detailed surveys prepared by the individual central banks on national monetary policy instruments and their use. Although there was a gradual and significant increase in the exchange of information about domestic aspects of monetary policy, the money supply projections continued to be prepared separately on a national basis. The IMF remained the principal source of objective information for assessing the general monetary situation in the EC member states. Discussion in the various EC monetary committees proceeded predominantly on information volunteered by national policy-makers (often only orally for current issues) and no major initiatives were produced to improve the coordination (Gros and Thygesen 1992: 22).

Policy co-ordination – or more often *attempts* at policy co-ordination – was intensified in the context of the tighter fluctuation margins of the ERM of the EMS, which increased the significance of central bank governor discussions. This was in part due to the creation of a new credit mechanism, the extension of the repayment period of credit supplied under the short-term monetary support mechanism and the enlargement of medium-term financial assistance for this repayment. Moreover, the governors were given additional powers: by unanimous vote, they could decide on the use of 'debtor rallonges' to extend additional credit beyond the automatic extension of repayment allowed to debtor countries. During the 1980s, these facilities were gradually extended. However, it is important to stress that these support mechanisms were never very significant to the operation of the EMS because

they formed only a small percentage of the reserves used by NCBs in their interventions. A central issue in the negotiations leading to the creation of the EMS had been establishment of some objective indicator or threshold (the 'divergence indicator' calculated in terms of ECUs) to trigger automatically policy co-ordination discussions. Had the indicator actually been used – it was not – this would have increased the role of the central bank governors even more. Overall, co-ordination remained limited because the EMS was principally a 'limited, defensive mechanism to improve monetary stability' (Gros and Thygesen 1992; 52). Moreover, even though the EMS involved increasing the common pool of European reserves as well as a system of compensation for holders of ECU, it did not involve transferring control over these reserves and this system – managed by the BIS – to the EMCF, which remained limited to its bookkeeping function.

In their April 1978 initiative on the EMS, French President Giscard d'Estaing and German Chancellor Schmidt called for the EMCF to be transformed into a European Monetary Fund (EMF) within two years of the start of the EMS: to manage pooled exchange reserves in accordance with a joint exchange-rate policy and offer balance of payments assistance. However, in the ensuing negotiations the Germans and French failed to agree upon what the EMF should do and plans for it were quietly shelved in December 1980. In 1982, the Commission produced a note listing ten possible tasks for the EMF, ranging from the relatively insignificant assumption of the accounting functions of the EMCF to responsibility over realignments in the EMS and for formulation of a joint monetary policy. The French had wanted the EMF to manage exchange reserves and promote the use of the fledgling European currency unit, the ECU, as a reserve currency and a repayment instrument. Crucially, the Germans (the Bundesbank) had feared that with more power to manage the ECU, the creation of the EMF would have inflationary consequences, especially given that it would be under the formal control of ECOFIN (Emminger 1986). Also, as with the Werner Plan, the EMF was overtaken by events: the international economic downturn of the late 1970s and early 1980s and the continued divergence in inflation performance among EC countries. The EMF saga suggests unmitigated failure. However, it also provided a useful lesson for EC governments, encouraging them to embrace a different approach to institutional matters in the late 1980s: the strengthening of a European monetary authority could only be achieved in the context of a larger project of monetary integration which satisfied German concerns on inflation and the authority's independence.

Furthermore, the opposition of the Bundesbank to the EMF demonstrated that future institutional reform ideas should first be vetted by the central bankers in their Committee rather than presented as a virtual *fait accompli* by political leaders.

The increased subtleties of co-ordination in the context of the EMS and difficult realignment negotiations increased the reliance of governments on the Committee of Governors and the Monetary Commitee. Gradual capital liberalization in the 1980s would impose even greater demands on monetary co-ordination. Moreover, the governors played a central role in EMS reform, sought above all by the French: the details of the September 1987 Basle-Nyborg agreements were prepared and first approved by the Committee of Governors in Basle (and subsequently by ECOFIN in Nyborg). The reforms involved measures to strengthen the operating mechanisms of the EMS including interest rate co-ordination among participating finance ministries and NCBs and the promotion of the more effective use of the credit support mechanisms.[12] However, these reforms did not reinforce institutional structures *per se*. Most central bankers were interested in discussing further monetary union. However, they were generally pragmatic about it. They preferred to develop the full potential of the Basle-Nyborg agreements within a system of voluntary co-ordination (Gros and Thygesen 1992). The Committee of Governors sought to 'strengthen the procedure for joint monitoring of economic and monetary developments and policies with the aim of arriving at common assessments of both the prevailing conjuncture and appropriate policy responses.' (Committee of Governors 'Press Communiqué' 18 September 1987), which remained a core objective right up to the start of Stage Three of EMU in 1999. The governors sought a better balance between exchange-rate movements within the fluctuation margins, changes in interest-rate differentials and interventions.

The French drive for EMS reform and the Genscher initiative

Mitterrand's March 1983 decision to keep the franc in the ERM made possible future developments in monetary integration. In 1985, Jacques Delors, as Commission president, (supported by the French) sought unsuccessfully to include mention of a European monetary authority in the Single European Act (SEA) (1986), although the goal of eventual EMU was incorporated into the Act's preamble and the EMS and the ECU (described as the 'European currency') were brought into

the scope of the treaties. Of potential significance for the future development of European monetary authority, the SEA applied the unanimity rule of Article 236a to any institutional development in the field of economic and monetary policy – which meant that it could be vetoed by the British government. The new French neo-Gaullist-led government of Jacques Chirac (1986–88) began actively pushing for a reinforced EMCF to promote the use of the ECU which was seen as a way to challenge the supremacy of the German mark (Balleix-Banerjee 1999; Howarth 2001). This was part of renewed French efforts to achieve greater symmetry within the EMS: to increase strong currency central bank support for weak currencies (notably increased and obligatory Bundesbank support for the franc, through increased interventions and co-ordinated interest rate changes). On a few occasions in 1987, in newspaper interviews and speeches in France, the neo-Gaullist finance minister, Edouard Balladur speculated on the possible eventual creation of a new European monetary authority, anticipating the most important issues discussed in the Delors Committee and during the intergovernmental negotiations on EMU in 1990 and 1991.[13] The questions that he posed – in place of specific proposals for the establishment of a new European monetary authority – suggest that he, or at least his advisers, had actively considered the transformation of the EMCF, but that this was not a high priority for the moment.

Balladur reintroduced major institutional reform to the debate on the EMS in his memorandum of 8 January 1988. The French finance minister commented on the need for 'the rapid pursuit of the monetary construction' as a logical follow up to the Single Market programme and speculated on the creation of a 'common central institution'. Domestically, he and Chirac presented a far more gradualist vision and insisted that the creation of a reinforced European monetary institution was a long term issue, not of immediate importance, and refused to give details of their vision (Balleix-Banerjee, 1993, 1997 and 1999). However, the creation of some form of European monetary institution became an issue of debate – albeit a minor one – during the 1988 French presidential election campaign. Acting independently of the French government, the 'fathers' of the EMS, former President Giscard d'Estaing former West German Chancellor Schmidt joined forces again to lead the campaign for the establishment of an ECB. In late 1986 they set up the Committee for the Monetary Union in Europe which included former politicians, central and private bankers and academics as members (Dyson 1994).

In 1987, they also encouraged the establishment of the Association for Monetary Union in Europe (AMUE) which included several European large industrial companies as members. The Association published statements and the results of surveys demonstrating the largely favourable attitudes of company bosses to EMU. On 24 February 1988, Giscard and Schmidt presented a statute for an independent central bank (*Le Monde*, 25.2.88). Likewise, leading members of the Bank of France called for a hard European currency and European central bank to manage it.[14]

On 26 February 1988, to the surprise of most observers, the German Minister of Foreign Affairs Hans-Dietrich Genscher submitted a memorandum with the title 'A European Currency Area and a European Central Bank' which presented both as an 'economically necessary completion of the European Internal Market' (Genscher, 1988). Genscher had seized the opportunity to forward his federalist agenda and presented what was in fact a conciliatory position between the old 'economist' and 'monetarist' positions in order to forward discussions on EMU (Genscher 1995, 1998). On the one hand he argued that a 'common' currency and a federal European system of central banks was crucial to help build economic convergence necessary to make monetary union work. In his effort to make his project appealing to the French and Italians, Genscher emphasized that the ECB should be set up in order to promote the use of the ECU as a general means of payments in Europe and reduce European dependence on the dollar. His project was criticized both by the German Ministry of Finance and, more publicly, by the Bundesbank. However, Genscher's insistence on the autonomy of the ECB and NCBs from political instruction and the sole goal of price stability reflected one of the core German demands during the ensuing discussion: that the ESCB would have to follow a German institutional design or EMU would not proceed. The ESCB must not be obliged to finance public sector deficits. Likewise, the ESCB would mirror the federal organization of the German system of central banks with an appropriate balance between central and federative elements in its decision-making. Drawing on the German Stability Act of 1967 and the Amato memorandum of 23 February 1988, governments would also be expected legally to commit themselves to price stability. These formed the core elements of the institutional design for EMU subsequently agreed upon. Finally, Genscher called for a small group to be created at the June 1988 Hanover European Council to draw up a more precise project for EMU in order to forward the project rapidly.

The Delors Committee and the ECB

At the Hanover Summit, it was agreed to create a committee consisting mainly of central bank governors, chaired by the Commission president Jacques Delors, to examine the practical steps leading to EMU. The decision by Chancellor Kohl, President Mitterrand and Delors to leave the matter initially to the central bankers (in addition to three independent persons, Delors and the European Commissioner Frans Andriessen) acting in a personal capacity, reflected the recognition that German (Bundesbank) demands on central bank independence were a *sine qua non* of the project. National treasury officials from several countries balked at German demands on autonomy and focused a great deal more on the economic side of EMU and the matter of the dialogue between economic and monetary policies – as demonstrated by the recommendations of the High Level (Guigou) Group which, during the 1989 French Council presidency, was in charge of preparations for the Intergovernmental Conference (IGC) on EMU. Moreover, the difficulties created by the exclusion of the Committee of Governors in the initial preparation of the EMS and the relative success of the discussions leading to the Basle-Nyborg agreements served as useful reminders that central bankers should be placed at the centre of discussions. The Delors Committee was charged with the responsibility of examining both the economic and monetary aspects of unification, the transition and above all the requirements for achieving EMU. Although the Committee outlined provisions for the ESCB, it was not mandated to propose a draft statute for a European central bank. This was to be left to the Committee of Governors after the publication of the Delors Report, although an unofficial group chaired by an academic Jean-Victor Louis and consisting of central bank officials (notably those with legal expertise) worked on the ESCB design. The central bank governors agreed unanimously on the Delors Report, released in April 1989, and the work of the Louis group was published shortly afterwards.[15] Both provided a blueprint for the draft statute of the ESCB and of the ECB which was subsequently adopted by the Committee of Governors in November 1990.[16] Only minor modifications were subsequently made to the institutional structure of EMU. However, several matters eluded agreement in the committees and could only be resolved in the following IGC.

The Delors Report embraced and clarified the conditions outlined by Genscher in his memorandum and by Bundesbank President, Karl-Otto Pöhl in his own paper presented to Committee members at the start of

their work in September 1988.[17] The German inspiration is very clear: the 'epistemic community' of central bank governors and other experts all shared the Bundesbank's predilection for guarantees on price stability and autonomy from political authorities and several had been struggling for years to increase their autonomy (Verdun 1999; for the French example, see Prate 1987). The bank governors accepted, however, the need for accountability and called for reporting requirements in relation to the European Parliament and the European Council. What is perhaps surprising is that the alternative major model for an independent federal system of central banks – the American Federal Reserve – was not seriously considered by the governors as it had been by the Werner Committee. Moreover, the European Council and ECOFIN's acceptance of the Report without serious disagreement is perhaps also surprising especially given that several national finance ministries and governments had a long tradition of opposition to increased NCB autonomy. Most of the governors subsequently campaigned publicly for independent central banks, both prior to and after the agreement by the Heads of State or Government in principle to accept independence at the October 1990 Rome I European Council.

The major issues of disagreement among the central bank governors and member state governments concerned the timetable to move to EMU, the role of the ECU and that of European monetary authority during the transition period from Stage One (the full liberalisation of capital movements) to the start of Stage Three, the irrevocable fixing of parities and the transfer of monetary power to the ECB. Due to this disagreement, the Delors Report's description of the two transition stages is brief and vague. Notably, an important paragraph in the Report in chapter III, section 1 ('gradualism and indivisibility') was left out. Pöhl was very critical of the sharing of monetary power during the transition period given the confusing signals that this could send to the financial markets. Monetary power had to be indivisible. Other Committee members agreed but felt that this did not prevent some functions from being transferred to the ESCB. The Report recommended only minor reinforcement of the powers of the Committee of Governors and its secretariat to improve the co-ordination of independent national monetary policies. In Stage Two, the ESCB would be set up and begin the transition from this co-ordination to its control over the formulation and implementation of the common monetary policy in Stage Three. While the central bank governors established the date of 1 July 1990 for the start of Stage One (the date by which capital liberalization in the EMS member states was to be completed), the

starting date of the second stage, when they thought the ESCB would begin operating, eluded agreement. Moreover, the Delors Report was very vague on the institutional developments and nature of co-ordination of Stage Two, in part because the central bank governors argued that 'this [transition] would depend on the effectiveness of the policy co-ordination achieved during the first stage, on the provisions of the Treaty, and on the decisions to be taken by the new institutions' (para. 57).

Verdun (1999: 185) sums up the importance of the Delors Committee in the move to EMU as fourfold (see also Dyson 1994). First, the Committee accepted the German model of central banking for the ESCB (independent central banks and price stability) whereas politicians may not have done so. Second, the central bankers and other monetary experts had the technical expertise to suggest a credible blueprint for the EMU project. Third, all the member states were 'represented' by their NCB governors which eased the acceptance of most of the member states. Finally, the Delors Committee can be seen as having drafted the 'right kind' of EMU: one that contained the 'necessary ingredients' for success yet went beyond the 'lowest common denominator approach. In this sense, the Committee fulfilled some of the core characteristics of an 'epistemic community'.

It should also be noted that in addition to this debate on the role of European monetary authority in Stage Two, there were alternative approaches to the move to EMU – forwarded principally by the British government but also several leading political parties and economists in all the member states – than that recommended by the Delors Committee. The adopted approach was 'institutional' in the sense that it accepted that some form of new monetary institution was required to manage the transition to Stage Three and that a full blown ECB would eventually be created. The two major market-led approaches – explicitly rejected by the Delors Committee – involved considerably less institutional implications. The competing currency approach (Gros and Thygesen 1992: 329–32) rejected altogether the need for institutional developments: market forces would determine the success of the various existing national European currencies and the best would win and become the single European currency and, presumably, that currency's central bank would become the European Central Bank (with subsequent institutional modifications). All legal restrictions on the use of currencies, exchange-rate fixing and the co-ordination of national policies would cease to be necessary. The parallel currency approach – an EC currency circulating in parallel with the member state currencies

(Gros and Thygesen 1992: 332–8) – also relied principally upon market mechanisms. However, this approach involved an institution to manage the new currency in order to promote its use by the private sector.

The draft submitted by finance ministers to the Maastricht European Council in December 1991 was nearly the same as the one prepared by the Committee of Central Bank Governors. However, there were two major differences in the tasks of the ESCB. First, the governors sought to give the ECB full power over exchange rate policy whereas the finance ministers decided to divide responsibility between the Council of Ministers and the ECB. Second, the finance ministers agreed to give the ECB a lot less power over prudential supervision of the banking system. The Governors had recommended that the ECB 'would participate as necessary in the formulation, coordination and execution of policies relating to prudential supervision and the stability of the financial system' and be 'entitled to offer advice and to be consulted' on the interpretation and implementation of EC legislation concerning prudential supervision. The finance ministers decided that the ECB should merely 'contribute to the smooth conduct' of policies designed and pursued by others. There were also several minor differences in the two drafts. One example had potential implications for the ECB's pursuit of price stability. The Committee of Governors' draft read that the 'ESCB shall support the general economic policies *of* the Community' (italics added) whereas the finance ministers final draft read 'the general economic policies *in* the Community'. According to Kenen (1995: 30) the word 'of' was apparently 'seen to invite the ESCB to disregard the policies of the individual EC countries and seemed also to invite the Community to adopt a wide range of common policies'.

The Committee of Governors in Stage One of EMU

Following the recommendation of the Delors Report (April 1989), the June 1989 Madrid European Council agreed to start Stage One of EMU on 1 July 1990. Based on the recommendations of the Delors Report (paras. 50–2) ECOFIN granted the Committee of Governors additional responsibilities from the start of Stage One (Council Decisions dated 12 March 1990 to replace the Council Decision of 1964). A responsibility assigned to the Committee of Governors was to start preparations for Stage Three of EMU by identifying the major issues and establishing a work programme by the end of 1993. Stage One was also supposed to be about tighter *voluntary* co-ordination of monetary policies made

necessary by the greater degree of exchange-rate fixity combined with financial market integration. The Committee of Governors was given new means to achieve this co-ordination. First, the new Council Decisions implied that the Committee of Governors could develop a more visible public profile, with the publication of an annual report and appearances of the Committee Chairman before the Economic and Monetary Committee of the European Parliament. Increased visibility was important in the context of the gradual construction of the future European monetary authority's credibility and legitimacy through demonstration of its accountability. The first report of the Committee (covering the first 18 months of Stage One to the end of the 1991) was published in April 1992. Moreover, the Decisions allowed the Committee of Governors' Chairman to decide to make public the deliberations of the Committee at any point in time.

Second, the Committee was encouraged to make critical reflections on the economic and monetary policies of individual member states and the EMS participants as whole. These critical reflections could appear in the Committee's reports to the European Council and Parliament or in the deliberations made public by the Committee Chairman. In theory, the Committee of Governors already possessed the power to make critical comments, although this power was severely curtailed by the control exercised by national ministries of finance over most of the NCBs. Moreover, the Committee had avoided criticism in the past because of considerations of collegiality and concerns about upsetting financial markets. It continued to do so, with a few notable exceptions. Most significantly, on 12 December 1990, the Committee of Governors agreed to ask publicly the German government to reduce its budget deficit, noting that it weighed too heavily on monetary policy and created tensions within the EMS (*Agence Europe*, 13.12.90, 5390).

Third, the ministers of finance hoped that the Committee would strengthen its analytical capacity (and its sub-committee structure) in order to develop an *ex ante* approach to, rather than an *ex post* analysis of, monetary co-ordination. The central bankers from the smaller member states were particularly keen to push ahead: they had few illusions about their remaining monetary autonomy. However, there were several obstacles to *ex ante* co-ordination, in addition to different monetary policy instruments and the reluctance of some of the larger member state central banks to change their ways. In several systems – including the UK and France – monetary authority was divided and ministries of finance (and governments) were unwilling to delegate

some of their powers to an unspecified process of central bank co-ordination. Moreover, in some systems – notably, the German federal system – the organization of the central bank's decision-making structure made difficult the delegation of any power through its president (or other representatives) to a European monetary authority.

The failure of the Committee of Governors to establish co-ordinated intermediate monetary targets for 1991 was the first demonstration of the weakness of Stage One procedures to build voluntary co-ordination. The establishment of these targets for 1991 was arguably too ambitious. However, the governors also failed to achieve a less ambitious goal: an agreement of a quantitative assessment of the monetary objectives of the participating countries. This failure was due to three problems (Gros and Thygesen 1992; 347): first, the difficulty of agreeing to joint assumptions about external shocks (due to temporary uncertainty about oil prices and the dollar); second, the differences in monetary or credit aggregates used by the participants; and third, the disagreements as to the role that such aggregates could play in fostering co-ordination. In order to overcome the second problem, in 1991, the Committee of Governors set up an Economic Unit to work on building statistical compatibility and harmonizing concepts of the aggregates used by the different member states. However, progress in Stage One was slow.

The Committee of Governors failed to improve co-ordination sufficiently to challenge speculation against most EMS currencies in 1992 and 1993. The efforts undertaken in Stage One did not compensate for the underlying change in the EMS which undermined stability: notably rising German inflation; lower French (and other country) inflation; the corresponding weakening of the position of the German mark as the ERM anchor currency; the record high interest rates in France and other EU countries; economic recession and rising unemployment in most participating countries. The most effective co-ordination during this period was bilateral, notably 'the sweetheart deal' between the French and German ministries of finance and central banks, first arranged to keep the franc in the ERM in September 1992, and then repeatedly referred to as a weapon to stem the periodic bouts of speculation over the next ten and a half months. This deal amounted to the public engagement of the Bundesbank to provide unlimited support to the franc to defend it against devaluation. However, given the Bundesbank's refusal to provide this unlimited support in late July 1993 – given the potential inflationary effects – the franc was forced to devalue. In order to the save the ERM and ease speculation, participat-

ing ministers of finance (with central bank governors in attendance) reached a deal at the 1–2 August Brussels Extraordinary ECOFIN to widen the mechanism's margins of fluctuation from ±2.25 to ±15 per cent. The widening of the ERM margins nullified the practice of monetary cooperation built up over the preceding 14 years of EMS operation and dramatically diminished the role of the Committee of Governors. It became superfluous to monitor the operation of the EMS and manage its credit facilities because interventions in the foreign exchange markets were minimal. Following the experience of July 1993, the French sought to strengthen their convergence programme with the Germans: starting in August, the two countries' programmes were planned in 'tight concertation' and presented to the press simultaneously (Howarth 2001). However, this did not involve reinforced co-ordination on the part of central bank governors.

The European Monetary Institute in Stage Two of EMU

The date for the start of Stage Two, 1 January 1994, was agreed at the October 1990 Rome (I) European Council (and confirmed subsequently by the October 1993 Brussels extraordinary European Council). However, the actual powers of European monetary authority remained a subject of considerable debate throughout much of the IGC and subsequently. The opposing sides corresponded to the traditional 'monetarist' versus 'economist' divide. The French had – as demonstrated in their January 1991 Draft Treaty – a maximalist interpretation of the role of the EMI to promote actively the ECU. The Germans, however, sought a minimal EMI – indeed, with virtually no powers beyond those already granted to the existing Committee of Governors. The Delors Committee had clearly leaned towards the German vision: '[Stage Two] must be seen as a period of transition to the final stage and would thus constitute a training process leading to collective decision-making, while the ultimate responsibility for policy decisions would remain at this stage with national authorities' (para. 55). As in Stage One, monetary authority was seen as indivisible. Nonetheless, all the national governments recognised the complexity of managing the EMS – with the ultimate responsibility for monetary policy remaining in national hands – while preparing for EMU and the transfer of power to the ECB in Stage Three. At the ECOFIN Apeldoorn meeting on 23 September 1991, EC ministers of finance agreed to French demands on the automaticity of Stage Two but they only allowed the creation of an EMI with minimal powers: the German vision had prevailed. Meeting in

Basle on 29 October, the governors left open certain aspects of the statutes of the EMI – including the structure of the direction; the voting procedures within the Institute; the constitution of its capital and its location – on which agreement eluded them. The final provisions of the Maastricht Treaty ensured the creation of an institute with a legal personality, to be directed and managed by a Council, consisting of a President and NCB governors (article 109f.1). Control over monetary policy would be transferred to the European level only with the creation of the single currency at the start of Stage Three. The Treaty on European Union included the protocols on the Statute of the ESCB and of the ECB (see Appendix 1) and the Protocol on the Statute of the EMI.

The EMI Executive Board consisted of 13 members (16 following the 1995 enlargement) including the president and all EU central bank governors. All the EU member states participated in Stage Two of EMU, including Britain, Denmark and Sweden. Thus, perhaps oddly, the central bank governors from the three countries which did not intend to join the first wave of countries moving to Stage Three, nonetheless participated in all the discussions and preparations for the move to EMU. The Institute was assigned the responsibility to strengthen cooperation and co-ordination between the member state central banks with the aim of ensuring price stability, to assume the responsibilities previously assigned to the EMCF and the Committee of Governors, and to facilitate the use of the ECU and oversee its development (including the smooth functioning of the ECU clearing system) (article 109, TEU and article 2, EMI Statute). By the end of 1996, the EMI was to specify the 'regulatory, organizational and logistical framework necessary for the ESCB to perform its tasks' (article 4, EMI Statute). Specifically, the EMI was to:

- prepare the instruments and the procedures necessary for carrying out a single monetary policy in the third stage;
- promote the harmonization, where necessary, of the rules and practices governing the collection, compilation and distribution of statistics in the areas within its field of competence;
- prepare the rules for operations to be undertaken by the national central banks in the framework of the ESCB;
- develop the framework for conducting foreign exchange operations as well as for holding and managing the official foreign exchange reserves of the member states participating in the Euro-Zone;
- promote the efficiency of cross-border payments; and

- supervise the technical preparation of ECU bank notes (article 4, EMI Statute);

The EMI Council was granted minimal powers to formulate – by a two-thirds majority of its members[18] – and submit opinions and recommendations to the Council on the orientation of monetary policy and the functioning of the EMS as well as the monetary and exchange rate policies in individual member states (article 109f; protocol article 5). Article 6 of the Protocol allowed the EMI to hold and manage foreign exchange reserves as an agent for and at the request of national central banks. However, the pooling of reserves remained voluntary and as no NCB asked the EMI to manage its reserves prior to the start of Stage Three, the Institute effectively assumed the bookkeeping responsibilities of the EMCF. At the 1991 Maastricht European Council, the Heads of State or Government finally reached a compromise on one of the most difficult issues during IGC: the timetable to move to Stage Three, either in 1997 or automatically (for qualifying member states) in 1999.

The move to Stage Two and the creation of the EMI proceeded on schedule. At the December 1993 Brussels European Council, Alexandre Lamfalussy, the Belgian former head of the BIS, was selected as the first president of the EMI. He was seen as a safe pair of hands: the decision was uncontroversial, acceptable to all the member state governments, including the Germans.[19] One potential obstacle – regarding location – was overcome at the October 1993 extraordinary European Council, where the European partners agreed to place the EMI and thus the future ECB in Frankfurt. The French had favoured Lyon. However, Chancellor Kohl insisted upon Frankfurt on the grounds that a German location was needed in order to assuage the large number of Germans hostile to the loss of the mark and the transfer of monetary power to the European level and to address, symbolically, the fear that the ECU (as it was then called) would be much weaker than mark and that the ECB would have difficulty maintaining low inflation.[20] The selection of Frankfurt likewise had another symbolic purpose: to signal to the financial markets that the ECB would be as diligent as the Bundesbank in the maintenance of price stability.

In terms of real policy co-ordination, it turned out that Stage Two amounted to an extended Stage One. The French saw the co-ordination difficulties and EMS instability in 1992 and 1993 as an important reason to expand and clarify the co-ordination role of the EMI (Jaillet 1994). The Maystadt Plan, presented by the Belgian minister of finance to his European colleagues unsuccessfully pursued this objective. The

co-ordination difficulties and the stability created by widening the fluctuation margins convinced the Germans that reinforced co-ordination in Stage Two was unnecessary. The EMI also chose largely to ignore the option of re-narrowing the EMS margins – which would have increased its co-ordination role – and focused most of its time and attention to its preparation tasks.

The EMI was much better equipped than the Committee of Governors to reinforce monetary policy co-ordination. First, the EMI Council was granted a strong degree of autonomy (EMI Protocol, article 8) – a foretaste of the ECB Governing Council's independence: members could not seek or take any instructions from EU institutions or bodies or member state governments. This autonomy was reinforced by the early move to NCB independence in several of the member states early in Stage Two. This autonomy increased the chance of criticism of the economic policies pursued by member state governments. Second, the EMI became a relatively large institution with a highly competent professional staff of over 200 by 1996, which could undertake independently some analytical functions, whereas the Committee of Governors had relied entirely on the NCBs. The Council and the Alternates Group were chaired respectively by the President and the Director-General of the EMI, who both devoted all their activity to the EMI, hence assuring the effective use of staff analyses. Third, the EMI's power to submit opinions and recommendations became more significant given the increasing independence of NCBs and the institute's greater professional analysis.

Some observers and participants (for example, Gros and Thygesen 1998) criticized the EMI for being insufficiently active in promoting co-ordination and collective evaluation of monetary developments, such as the significant movements in EU and other major currencies in 1995 and the strengthening of the Irish punt and British pound from 1997. However, the co-ordination role had become less relevant for reasons noted above – the wider fluctuation margins – because there were no crises in the EMS during Stage Two and most of the EU member states succeeded in maintaining price stability. Arguably a collective and public evaluation would have been more useful in the two years prior to the start of Stage Three. Policies pursued in this period would have a greater effect on inflation in the first years of EMU, and national and EMI inflation forecasts were of particular interest given that inflation targets would likely become an important factor shaping policy. Moreover, there remained the possibility of turbulence in the run-up to the selection of participating member states in the spring of 1998 and

the move to Stage Three. Gros and Thygesen (1992 and 1998) argue that the EMI could have played a more active coordinating role without undermining the 'ultimate responsibility' of national authorities' (1998: 426). In their opinion, the EMI should have prepared three elements as part of a 'useful learning process' to smooth the transition to EMU (as recommended in the Delors Report): 'a consensus on the specific formulation of the ultimate objective(s); a common analytical framework for intermediate objectives and for the design of monetary policy; and a sufficient degree of experience with common operations.' In particular, the expert authors bemoan the lack of experimentation in genuine joint decision making. In their individual papers appended to the Delors Report, Committee members made some suggestions as to the non-institutional steps in the transition period which could help build common policy-making. However, these were ignored during the IGC. Gros and Thygesen (1992) examine several possibilities for building common decision making with regard to adjustment of short term interest differentials, intervention policy vis-à-vis third currencies, the development of a Community-wide reserve requirement, realignments, and on the issue of a parallel currency (the ECU).

EMI documents focused instead on analysing the progress of the member states in meeting the Maastricht convergence criteria. With the criteria and the 1999 deadline in place, the EMI Board's monthly debates and regular reports on monetary policy and economic performance and convergence (summarised in the EMI's annual reports) assumed greater importance than those of the former Committee of Governors and helped nudge member states toward compliance.[21] Throughout Stage Two, the EMI gently chided the member states which were making inadequate progress. It also frequently criticised member states for 'one off' deficit cutting measures that did not ensure sustainable low deficits. In its 25 March 1998 convergence report, the EMI drew attention to the large debts and inadequately low deficits of several member states, recalled the medium-term aim of budget surplus established in the Stability and Growth Pact, and encouraged accelerated economic reform and 'decisive and sustained corrective policies of a structural nature' (EMI 1998). Although the final decision on which member states adequately met the convergence criteria and thus could join EMU remained the responsibility of the European Council and was announced by the Heads of State or Government on 2 May 1998, the EMI's March 1998 report was considered the more objective and authoritative statement on the suitability of member state participation.[22] The report stated that Greece was not prepared to participate in

Stage Three. By supporting Italy's participation in Stage Three – opposed previously by the German and Dutch governments – the EMI made its inclusion in the eleven first members more politically manageable.

The Institute also played a more active role in the preparations for EMU. The EMI successfully completed all the essential tasks outlined in the EMI Protocol article 4 (mentioned above) and published numerous documents approved at its 45 meetings between 1994 and the end of May 1998. The Institute:

- closely followed the development of the use of the private ECU/euro with annual reports.
- prepared the chronological sequence of events for the changeover to the euro (November 1995) (adopted by the December 1995 Madrid European Council). The EMI outlined differences between national changeover scenarios and the potential need for harmonized actions in a March 1997 document and submitted its own scenario.
- outlined the operation framework of the single monetary policy in a January 1997 document (which the TEU required by the end of 1996), the single monetary policy strategy of the ESCB (February 1997) and produced general documentation on ESCB monetary policy instruments and procedures and documents on several more specific points.
- set up the future monetary and exchange rate relationships between the Euro-Zone and other EU countries (the ERM-II).
- published its money and banking statistics compilation guide (April 1998): guidance provided to all EU NCBs for the compilation of money and banking statistics for submission to the ECB.
- clarified the rules for NCB operations: The EMI achieved several specific goals, outlined in the Statute of the ESCB and of the ECB.

1. It elaborated harmonized accounting rules and standards to make it possible to construct a consolidated balance sheet of the ESCB;
2. it put in place the necessary information and communications systems support for the operation and policy functions to be undertaken within the ESCB; and
3. it identified the possible ways in which the ESCB would contribute to the policies conducted by the competent supervisory authorities to foster the stability of credit institutions and the financial system.

- helped prepare necessary national and EU monetary and financial legislation, including the statute of the NCBs. It followed up on NCB reform in its annual reports.
- established foreign exchange rules (July 1997 common market standards for money market and foreign exchange transactions).
- developed the TARGET cross-border payment system (introduced in May 1995) and produced regular reports from August 1996 on the system's progress.
- organized a competition for the design of the new banknotes and selected a winner (approved by the December 1996 Dublin European Council).

As one of its final tasks, the EMI examined the irrevocable conversion rates for the euro. At a 2 May 1998 meeting, it agreed with the member state finance ministers and Commission representatives to use the existing ERM bilateral central rates of the participating currencies to determine the irrevocable rates.

The major final controversy in the lead up to EMU concerned the selection of the first ECB President. In May 1996, the NCB governors – with the approval of the Heads of State or Government – selected Wim Duisenberg, the experienced governor of the Bank of Netherlands, as the final president of the EMI. He was generally expected to become the first president of the ECB. However, the TEU granted the European Council the power to select the ECB president. At the December 1997 Luxembourg European Council, the political leaders failed to agree upon Duisenberg because the French President, Jacques Chirac, insisted upon the appointment of the Governor of the Bank of France, Jean-Claude Trichet. The French saw the presidency is an important symbol of monetary power: both the public and international face of the ECB. Placing Trichet in this position was thus of considerable importance to the French. It was also seen as an appropriate compromise given the decisions to establish the ECB in Frankfurt and to replace the ECU with the euro – both loaded with symbolic significance. Moreover, the French disclosed publicly that a secret agreement on Trichet's appointment had been reached with the Germans in October 1993 when Frankfurt was selected over Lyon. Owing to the important role of the future ECB president, the power motive went beyond the purely symbolic. The assumption was – regardless the autonomy of the Bank of France in relation to the French government – that Trichet's appointment would enhance French influence within the ECB during its crucial formative years and at the international level.

A lengthy and very public battle ensued. French stubbornness on this issue consumed most of the 25 May 1998 extraordinary Brussels European Council, where a compromise was reached. Duisenberg would stay on. However, to meet Chirac half way, the Dutchman agreed – supposedly 'of [his] own free will … and not under pressure from anyone' – to step down after mid-2003 to make way for Trichet.[23] In the meantime, the French would be adequately represented in the Executive Board, with the appointment of Christian Noyer, the former head of the French Treasury, as ECB Vice-President.[24] The compromise was made even more palatable for the French by the strategic appointment of another recent head of the Treasury, Jean Lemierre, as the first president of the Economic and Financial Committee, the rebaptized Monetary Committee. The incident increased the perception that the ECB's independence would be difficult to safeguard from the influence of member states. Moreover, the compromise was almost certainly illegal when viewed against TEU provisions because Article 112(2)(b) EC (ex 109a(2)(b)) requires that the term of the President's office last eight years (Craig 1999).

On 1 June, in accordance with Article 123 EC (ex 109L), the EMI was replaced by the ECB and the Executive Board began its term. With most of the preparatory work successfully completed prior to June 1998, the ECB devoted the remaining seven months of the year to the final testing of systems and procedures and establishing the rules of procedure of the General Council. There remained a few issues to resolve. One concerned the Euro-Zone's monetary policy strategy which was adopted by the ECB's Governing Council on 13 October (see Chapter 4). A second outstanding issue concerned the external representation of the euro. At the December European Council in Vienna, it was formally agreed to allow the ECB President to attend G7 meetings for discussions relating to EMU (for example, multilateral surveillance and exchange rate issues) and at the time of the agreement on the relevant sections of the meetings' published statements. The ECB was also previously granted observer status on the IMF Executive board.

On 1 January 1999, EMU was officially launched. Control over European monetary policy, including interest rates and monetary mass, was transferred to the ECB. The parities of the participating currencies were fixed irrevocably by the Council. All new national public debt was to be issued in euros and the TARGET payment system was put into operation. It remained to the ESCB central bankers the task of bringing into circulation the euro banknotes and coins from the start of 2002. One of the most innovative developments in central banking

history and, indeed, the history of world governance, had begun. With over half a century of close, and progressively tighter, cooperation behind them, the Euro-Zone central banks were well placed in their unique position to operate the world's most important multi-national system of central banks.

3
National Attitudes on the ECB and Central Bank Independence

> Money is more than a part of the economy. Money reflects the state, politics, and culture. The euro (however) will be a denationalized and de-politicized currency.
>
> Hans Tietmeyer – Former Bundesbank President and ECB Governing Board Member.[25]

Introduction

Despite the focus of our previous chapter upon the role of European central bankers, the history of monetary cooperation and integration was dominated by the actions and interests of France and Germany, the axis of European integration. We argue that it is necessary to explore the interests and preferences of these two countries and their monetary policy-making traditions in order to understand both the design of the EMU project and the ECB in particular, as well as the current politics of the Euro-Zone in which the ECB must engage. Not to downplay the importance of other Euro-Zone members (the Dutch or Belgians, for example), the institutional structure, roles and powers of the ECB reflect the explicit preferences of these two leading EU member states, notably Germany. The on-going debate about structure, roles and powers is, furthermore, energized principally by French politicians and policy-makers. The emphasis placed upon central bank independence owes principally to the German monetary policy-making tradition. Most other Euro-Zone member states – notably the French – have traditions which rejected independence. This leaves an ideational legacy that views the operation of EMU, and in particular the inadequate political counterweight to the ECB 'Leviathan', with much concern on both political and economic grounds. We therefore

explore French attempts to construct some form of 'economic government' (EG) at the European level which could fill this role of political counterweight, and the diversity of ways in which EG has been presented by French politicians to different audiences. In particular, we examine French attempts to expand the role of the Eurogroup and develop European macroeconomic policy co-ordination. Contrary to the wishes of former Bundesbank and ECB member Hans Tietmeyer, the ECB operates in a political environment strongly shaped by member states.

The following analysis provides an overview of the historical, political and economic factors that have shaped – and continue to shape – the debates and policy developments in Germany and France with regard to central bank independence, the ECB and, more generally, EMU. Our ambition is to develop a more comprehensive understanding of the ECB and its operations. A short section is also devoted to the United Kingdom by way of comparison. The aim here is to explain how widespread traditional hostility to central bank independence in this country contributed to the persistent political hostility to EMU, yet also why, in the spring of 1997, one of the new Labour Government's first measures was to grant considerable autonomy to the governing board (the Monetary Policy Committee) of the Bank of England.

German monetary interests and attitudes: independence and price stability

German monetary interests were most influential in shaping the operation of the EMS, EMU and the institutional structure, roles and powers of the ECB. As a result, the current policy-making process and politics of the ECB bear a deep-seated teutonic flavour. Specifically, to understand Germany's monetary interests in EMU and the ECB is to zero in on a number of critical ECB issues examined in this book: the independence and the transparency of the ECB; the credibility of the ECB's monetary policies; the controversies over exchange rate management; and the interaction of the ECB and Eurogroup. In many ways, these issues mirror the politics and policies of the German national central bank, the Bundesbank, over its long and distinguished history (Loedel 1999a). The ECB was modelled on the Bundesbank, with its high degree of independence, its primary focus on price stability, its federalist structure (the Länder central banks), and its focus, in part, on monetary growth as a key target of policy-making. Moreover, without

Germany's political support for EMU, in particular the support provided by former Chancellor Helmut Kohl, EMU would not have happened. In fact, the ultimately political decision to sacrifice the treasured German deutsche mark for the euro is perhaps one of the most important in postwar German history – and perhaps postwar European history. Finally, with the ECB located in Frankfurt (the location of the Bundesbank) and the German-inspired Stability and Growth Pact guiding macroeconomic policy across Europe, the Germans have institutionalized the Bundesbank's legacy and monetary norm across Europe.

The following section examines the larger historical context of German monetary interests, the politics and policies surrounding the German approach to European Monetary Union, and the current operation of EMU and the ECB. We also examine the German views toward the concept of European monetary authority.

The historical context of German monetary interests

As part of the German national subconscious, monetary policy retains a prominent and consequential role in the political economy of Germany. In fact, the writing of German history can be punctuated by monetary affairs. The social and political consequences, to say nothing of the financial and economic ruin, of the hyper-inflationary period in 1923, for example, led to the undermining of the Weimar government's credibility and legitimacy, exacerbating the attacks of extremist movements on the left and right (Feldman 1993). Following the Second World War, the historic currency reform of 20 June 1948 launched the German *Wirtschaftswunder* that helped lay the foundations for the world-wide admired economic and political ascent of the Federal Republic of Germany (FRG) and its internal social stability and economic dynamism. German Economic and Monetary Union (GEMU) of July 1990 also marked a new era in German politics, as did the replacement of the DM by the euro during the first half of 2002.

These highly visible periods in German political and economic history illustrate the political nature of monetary policy and its importance as a fundamental socio-economic and political foundation or pillar of the Federal Republic of Germany. In fact, as these examples show, the stability and, in extreme cases, the very existence of the democratic order itself may depend on politically sensitive monetary decisions (Emminger 1986; von Arnim 1988). For example, von Arnim sets forth a theory of democracy that posits the primary importance of central bank independence to the stability and democratic order of the

German political system. In other words, the Bundesbank had become the guarantor of German democracy by acting as a guide, protecting the German government from irresponsible policy that could destabilize the democratic order. Arguably, then, monetary stability and social stability are one and the same. It is the confidence of the large German middle class (to say nothing of the upper class) in the money in their pocket, earned after years of hard work, that provides the building blocks of German democracy. German monetary interests and the policy that flows from it should, therefore, be examined for the political and social character it represents rather than in strictly economic or financial terms.

While always difficult to measure precisely or operationalize, the German economic culture is said to demand fiscal rectitude and a deflationary macroeconomic policy targeting price stability (Hanrieder 1989). Two leading commentators on the international political economy state the German case more bluntly: 'The German tribal memory heightens political awareness of the long-run penalties attached to inflation and, therefore, substantially assists inflation resisting policies' (Strange and Calleo 1984: 111). This economic culture gave German monetary policy a special quality, unique to the particular historical experience of the Germans. Some may label this deeply ingrained attachment to currency frugality a peculiar Germanic monetary angst or paranoia, but these features are staples of Germany's approach to monetary policy and EMU, and they reflect the broader social and political context in Germany and have developed into a distinct monetary ideology (see Noelle-Neumann 1968). This ideology presents a fairly simple yet stark view and message to the masses of the dangers of currency instability. This view is captured by Gordon Craig who states that 'the failure of the first German experiment with republican government was fore-ordained when the one commodity (money) that more than any other seemed to give people a means of rational assessment of their situation lost its power to do so any longer' (Craig 1982: 121). Unmistakably, social and economic conditions past, present and future play a powerful role in German society and the course of monetary policy.

This monetary ideology based on the fear of inflation and its socio-political consequence manifested itself in the institutional structures of the German political economy, in particular through the creation of the powerful Bundesbank. Most analyses of the German political economy cite the foundations of the Bundesbank in the postwar German constitution (*Grundgesetz*) which give German monetary

policy its special administrative and legal quality. Therefore, to understand German monetary interests is to examine the quasi-independent Bundesbank that commands a towering and lofty position within the political economy of Germany. For many Germans from all socio-economic strata, the Bundesbank guaranteed the soundness, stability, and foundations not only of the currency, the treasured DM, but also of the democratic and stable political order. Without a sound and stable DM, society could easily be buffeted by un-democratic forces bent on subverting the established political-economic order of which the Germans – rightfully so – are proud. The Germans learned their bitter lesson about defacing and devaluing a nation's currency and entrusted to the Bundesbank the task of defending the 'stability of the currency' (see, for example, Lehment 1981; Kennedy 1991; Marsh 1992).

The strength of public support for an independent central bank guaranteeing the value of their beloved D-mark added to the resources of the Bundesbank in times of conflict. An attentive German public opinion and political, financial and economic elite on monetary affairs helped guard the independence of the Bundesbank. However, if the central bank was badly out of step with current economic conditions and misunderstood the cycles of history, the clashes with finance ministers and chancellors were less easily hidden from public debate, and no amount of independence could save the bank from strongly defending its position with the public. The Bundesbank thus went to great lengths in maintaining a consistent and vocal public relations campaign. It is in this role that the Bundesbank mastered the art of public communication and speaking with one voice. More importantly, that voice focused on one overriding goal for German monetary policy and that goal is price stability. The Bundesbank continually returned to this familiar German monetary leitmotif – a leitmotif surrounded by an aura of familiarity and respect to the public. The goals, objectives and policies of German monetary policy, especially as espoused by Bundesbank officials, remained remarkably consistent over the decades. Significantly, the German voice acts as the conscious of the ECB as the message of price stability resonates strongly through the halls of the ECB.

Germany and EMU: interests and objectives

Given the powerful historical backdrop of German monetary preferences, one wonders why the German government did not dismiss the idea of EMU out of hand (given the implications of the prospective treaty). Despite some of the efficiency gains from a single currency,

Germany would not expect to benefit a great deal from the reduction in transaction costs (primarily on the export side rather than on imports) because a sizeable proportion of German trade within Europe was already denominated in DM. Nor would Germany immediately benefit from the anti-inflationary credibility of the future European Central Bank. Indeed, the reverse could happen. Even if the ECB's independence from political control was more formally guaranteed than the Bundebank's, it was arguable that the ECB would find it hard to inherit the Bundesbank's reputation and credibility. Moreover, the Bundesbank was not altogether convinced that other European central banks could deliver the same level of price stability. Finally, French pressure for a European-level political counterweight to the ECB (see the following section for more detail) raised additional red flags about the future independence of the ECB. In sum, the persuasiveness of economic or monetary motivations should not be stressed in understanding the German approach to EMU.

Instead, a political explanation is required to understand why the Germans were willing to offer the DM as the sacrificial lamb in return for EMU. Internally, the political will of Germany's leading politicians led to a great deal of overt and tacit pressure placed on the Bundesbank not to derail the negotiations on EMU. The key government players, Chancellor Helmut Kohl and his Foreign Minister, Hans-Dietrich Genscher, had a singular interest in EMU which reflected long-standing foreign policy goals and ideas – built on the Treaty of Rome and the Franco-German axis. Most importantly, European integration, while generally supported by the German public, was always an elite driven process of German foreign policy-makers. Moreover, the political importance of European integration for the foreign policy establishment expanded as Germany slowly reasserted its dominant political and economic position in Europe during the late 1980s. It was believed that German reassertion of power and influence could best be expressed with the comforting and binding constraints of the EC and an overall strengthened European identity. Finally, with the seeming month-by-month collapse and disintegration of Eastern Europe through 1989 and with the looming prospect of German reunification into 1990, the political (or foreign policy) salience of EMU moved to the foreground for German and European politicians. As the historic 'German problem' – the long held political, economic, and military-strategic concerns of Germany's geo-political position in the heart of Europe – came to the forefront of debate, irrevocably binding Germany to the EC, with monetary union as the crucial means for doing so,

became the negotiating mantra of German politicians and their European partners.

The Bundesbank was not blind to the pressures coming from politicians. The Bundesbank's distinctive position on EMU and the Maastricht Treaty negotiations is best summarized in its *Monthly Report for September 1990,* 'Statement on the Establishment of an Economic and Monetary Union in Europe'. The bank's views should not have been surprising to anyone and reflected long-standing principles associated with earlier European discussions on EMU, beginning with the Werner Report in 1970. The bank's cautious approach toward EMU centred on its belief in the coronation theory (*Krönungstheorie*) – the view that EMU must result only as the final stage of a prolonged period of convergence of key economic variables (notably inflation, but also budget deficits and public debt) and institutional safeguards (political independence of a European central bank). Apparently, the Bundesbank believed that convergence in line with the Bundesbank model would so slow down the process of EMU such that monetary union might not ever arrive. The bank also argued that 'substantial transitional problems as a result of the intra-German unification process', and the uncertainties in Eastern Europe justified postponement of any further steps on EMU 'until such time as the economic situation in Germany as a whole and in the European Community can be regarded as sufficiently consolidated'. The Bundesbank accurately and justifiably feared being pressed to support EMU because other countries had supported Chancellor Kohl's rapid movement on unification.

Given the political realities and the Bundesbank's concerns, the decision to sacrifice the DM was indeed a profoundly political move. There was some concern over the ambiguity of the protocols on exchange rate management as well as concern over the strength of other countries' commitment to the convergence criteria in the Maastricht Treaty. The timetables for implementing EMU were also seen as problematic by many Germans. But the Germans essentially got what they wanted – especially in monetary terms (Dyson 2001). First and most importantly, they got a powerfully independent ECB with a primary objective defined as price stability. Second, the strict (some would argue draconian) convergence criteria essentially demonstrated agreement among the negotiators that inflation was, in the words of former Bundesbank President Karl Otto Pöhl, 'democracy's enemy number one'. As such, success in ensuring price stability would be taken by many Germans as adequate testimony to the (European) central bank's accountability. Third, the federal structure of the ESCB

would still allow the Bundesbank to have a direct voice in European monetary politics. Moreover, each state committed itself to securing independence for national central banks – a radical departure for countries like France and the United Kingdom. As if the Germans had not gotten enough, in the years following the Treaty of Maastricht, the Germans demanded and received two additional points of monetary interest: the location of the ECB in Frankfurt and the Stability and Growth Pact. More importantly, the political power of the French-led effort to create a more substantial role for the new Eurogroup was significantly watered down. In essence, the Eurogroup would have no formal role in ECB deliberations and would not have any say over monetary policy.

Given the outcome of Maastricht and as the launch of the euro in 1999 approached, the Germans should have felt somewhat reassured that their monetary norm of price stability, central bank independence and fiscal rectitude had been enshrined in EMU and the ECB. But have EMU and the ECB's actions lived up to German expectations? The answer, in short, is largely no.

Germany, the ECB and the euro

Modelled after the Bundesbank and German monetary norms, EMU and the ECB seemed poised to serve the monetary interests of Germans. In addition, in macroeconomic terms, the euro has had very tangible benefits for Germans over the last few years. The cheap euro has boosted exports and employment in the all-important export-intensive sectors of the economy, all with minimal inflationary risks (outside of energy). In fact, German politicians have been accused of their own game of euro 'benign neglect' in order to stimulate economic growth and job creation. Furthermore, in the dynamic telecommunications, financial, and high tech industries, German companies have been on the forefront of developing new strategies – especially Euro-Zone mergers and acquisitions – to confront the newly competitive Euro-Zone market. In part, Germany's somewhat protected economy and society have opened up to the new euro reality and done so with great promise.

But Germans are still concerned about the future of monetary stability and whether national (read German) and European monetary interests will remain largely harmonious in the years to come. The future remained unsettled; the anchor function of the DM had been lost; more importantly, the European monetary ship of state was floating in entirely new seas and guided by a crew not dominated by

the Germans. To say that some Germans were unsettled by the situation was indeed an understatement.

While political and (most) economic elites were supportive, the German public was sceptical of the EMU plan from the start. Already resistant to the idea of relinquishing the DM for the euro, German citizens found added fuel for their EMU scepticism in the government's gold revaluation plan of 1998. As the launch dates for the ECB and EMU approached, the Kohl Government was skating on thin ice in its strong support for the euro – support that could not be found in the public. In a survey conducted by the Allensbach Institute, 47.4 per cent of the German public noted outright opposition to EMU (Loedel 1999b). Only 26.4 per cent signalled support for the euro project, with just as many Germans unclear in their position. More significantly, over 60 per cent of the public had real doubts and fears about EMU; at a ratio of almost 3:1, the German public felt that there were more disadvantages than advantages to the idea of EMU. Perhaps most important, fully 45.9 per cent of the public felt that EMU would have a negative impact on inflation. Also interesting, support for EMU was weakest among eastern Germans, not surprising given that they had only experienced a handful of years of monetary stability in the form of the DM.

Over the next three years, from 1 January 1999 to 1 January 2002, the public remained quite sceptical about EMU and the euro. German public opinion was not convinced that the euro would be as strong and stable as the deutsche mark. And many believed that the ECB would not be quite as vigilant as the Bundesbank in preserving the stability of the money. Given the weak track record of the euro and the repeated communication problems of the ECB during this period (see Chapter 6 for more detail), Germans were still questioning the decision to sacrifice the DM even as they handed over their DMs for euros. Specifically, the German public has been outspoken in its criticism of the euro's declining external value, as well as the operation of the ECB and Duisenberg's repeated misstatements. 'The Bundesbank would never have made the same mistakes' – was a typical German response to our surveys of German public opinion. Even the Social Democratic (SDP) government of Gerhard Schröder has been on the blunt receiving end of public scepticism. Schröder's initial support for the euro depreciation was rebuffed by public criticism so strong and vehement that he had to back down under fire. Indeed, monetary questions remain highly sensitive and overtly political in the German system.

For its part, the Bundesbank watches the unfolding euro drama with a mixture of suppressed delight and public concern. Even with the relinquishing of its power over monetary policy, the Bundesbank has continued to exert a strong influence in the ECB's monetary policy. For example, after only five months in operation, the Bundesbank took on a very public role in championing the euro as it headed toward parity with the dollar. Former Bundesbank President Hans Tietmeyer and current Bundesbank President (and ECB) member Ernst Welteke both signalled strong concern about the currency sliding toward the one dollar level. This was in sharp contrast to some other members of the ECB (and the German government) who were only giving half-hearted support to the euro. 'Clearly the decline in the euro's external value has been overstated', remarked Tietmeyer.[26] Moreover, when Italy was granted some concessions on its budget deficits for 1999, Bundesbank members lashed out at the deal suggesting that EU ministers had 'stabbed monetary policymakers in the back'. Other Bundesbank members described the decision as 'disastrous'.[27]

At the root of the Bundesbank's discomfort is the fact that it put its neck out on the line and, in 1997 and 1998, used its enormous credibility with the German public to reassure the public of the soundness of the EMU project. It consistently suggested the euro would be as strong as the DM. The fear now is that the ECB has neither earned the perception in the financial markets of the Bundesbank's credibility nor has the European bank the inherited authority of the Bundesbank. While most German central bankers note that it took the Bundesbank some time to earn its credibility and that price stability remained steady over the period 1999–2002, there is a good measure of discomfort with the ECB's performance on the communication and credibility front.

The public remains vigilant. All sections of German society are intense 'ECB watchers'. German journalists complain that the press conferences of the ECB come later in the afternoon – different than the Bundesbank – and too late to make the evening news or press editions. German economists have criticized the monthly reports as lacking in enough detail and information. Professor Jürgen Donges, chair of the economic committee known as the 'five wise men' which advises the German government on economic issues has argued that Germans were bitterly disappointed with the EMU project and that they had been promised that the euro would be equal to the DM (*Financial Times*, 6 May 2001). More fundamental structural reform was needed – in labour markets, social security and tax systems, and in countries like

France and Italy – but also Germany. Interest groups also have raised their concerns: labour unions that the ECB has been too tough especially with growth slowing through 2001 and 2002 and savings associations that the ECB has been too soft on inflation. While it is impossible to satisfy all interests, the ECB has struggled to portray a united front to this highly informed and engaged German public.

Even with the successful changeover to the euro on 1 January 2002 and the ECB's seemingly authoritative control over European monetary policy, most Germans still remain fearful of the potential rise of a political counterweight to the ECB. Such concern is drawn from the continued French insistence on some form of an EU-level *gouvernement économique* as well as the potential for continued political concentration of EU authority. Such concerns were formed early in the ECB's history. The dramatic confrontations in early 1999 between the new SPD Government – in particular the finance minister Oskar Lafontaine – and the ECB indicated to many Germans the dangers that the ECB faced in its new task of defending the euro's stability. Despite the popular support for Schröder (and his election victory in September of 1998), the public did not elect him to take on the ECB. Lafontaine's repeated public demands for lower interest rates and target zones for the euro's exchange rate upset many Germans – even Social Democrat supporters. Lafontaine's resignation in March of 1999 – just three months after the euro's launch – is indicative of the sensitivity with which Germans viewed the pressure on the ECB as inappropriate. The replacement of Lafontaine with Hans Eichel – a more moderate less ideological former state premier of Hesse with close contacts with the Bundesbank and the current Bundesbank President Ernst Welteke – helped smooth over some of the earlier tension. But pressure to restructure the Bundesbank to conform with the increasing needs for a more centralized EU process of regulating the integrating financial services industry and banks has put the Bundesbank (and especially the Land central banks) on the defensive.

The particular German view toward European monetary authority outside the hands of the ECB is, as noted, driven by the particular German view and history. Yet the Bundesbank never retained absolute independence from political influence from the chancellor or the finance minister. German chancellors – from Adenauer to Schröder – have repeatedly expressed views on monetary policy at odds with those of the Bundesbank. And while the Bundesbank often actively resisted these overtures, it could still be held accountable for its actions by the German parliament (*Bundestag*). The legislation creating the Bundesbank

– while constitutionally inspired – could be amended by a simple majority vote in the parliament. The government could also delay Bundesbank monetary decisions by two weeks, if deemed necessary by the chancellor. And external financial arrangements and exchange rate management remained firmly in the hands of the government. In short, the Bundesbank was never quite so independent from the government as many believed.

As a result, the real failure to develop an effective political counterweight to the ECB should say something about the high level of political independence that the ECB retains – greater than the Bundesbank (see the following chapters for more detail). German fears about French-led efforts to create some form of EU-level macroeconomic authority with power over the ECB should be understood from this perspective. Even the Bundesbank recognized its own political limitations. The Bundesbank at times retreated on policy differences in the face of political pressure from the government so as to insure its long-term independence (Goodman 1992). For now, the ECB has not had to retreat on any monetary policy decisions in the strict definition of its interest rate policy. With no immediate plans for a more formal or more powerful role for the Eurogroup, Germans should not be concerned about the ECB succumbing to political directives.

In the future, will the residual public discontent with the euro spillover into official government discontent with the project? And will this carry over into the European policy-making arena? There are a number of factors which suggest not: the relative stability of prices; the stabilization of the euro since 2001; recognition that EMU has always been an elite driven process; the weakness of any form of political counterweight to the ECB; the fact that the ECB may be slowly learning from its public missteps; Germany's own failure in 2002 to respect the rules of the Stability Pact and support for a more flexible application of this Pact. More importantly, with the highly successful changeover of the euro in the first months of 2002, Germans have come to accept the euro as a part of their economy and as a part of German history.

French attitudes on European monetary authority: a story of persistent reluctance

The French reluctantly accepted the German-imposed design for the ESCB and independent central banks. Despite the well-entrenched French aversion to central bank independence, President Mitterrand prioritized the achievement of monetary power objectives in the

context of pooled control over monetary policy at the European level. The willingness to accept compromise only came after over a decade of failed attempts to reform European monetary mechanisms to create a more symmetric system in which strong currency central banks (notably the Bundesbank) would share the burden of inter-parity stability by intervening to support weak currencies. The French also consistently supported the expanded use of the ECU, in part as a means to challenge the predominance of the deutsche mark in the EMS. The first national proposals to strengthen European monetary authority thus came from the French who saw this authority's principal task being the promotion of the ECU and eventually its emission as a hard currency. These proposals did not, however, advocate EMU. President Mitterrand imposed the EMU project upon a largely sceptical government, political class and financial administrative elite.

French aversion to central bank independence was rooted in four different factors: the French republican tradition; the belief that control over economic and monetary policy should not be separated; the perception – rooted in the history of French political economy – that low inflationary economic policies can be maintained by democratically elected officials, guided by enlightened bureaucrats and advisers; and power considerations within the French administration. This opposition shaped French positions on the details of the EMU project, the intergovernmental negotiations and their outcome. An appreciation of this opposition is thus necessary to understand the nature of French motives for supporting EMU and the process leading to monetary integration.

The republican tradition in France upholds the control of democratically elected officials over all elements of policy-making. This was reinforced by the strong tradition of '*volontarisme*'. In the case of monetary policy, this must be qualified. The Bank of France enjoyed a semi-autonomous status from the middle of the nineteenth century (Bouvier 1988; Prate 1987). The minister of finance had more or less influence over the decisions of the Bank depending on the matter at hand (a consensus normally existed) and the personalities involved. The height of the Bank's expression of autonomy was during the interwar period of monetary instability when certain Bank governors forced modifications in government economic policy in order to ensure greater stability. On the Left, the Popular Front sought to curtail the growing power of the Bank through a major reform of 1936. Following the Second World War, the autonomy of the pre-war period was widely associated with the protection of elite interests, the general

backward state of the French economy, the Laval deflation of the mid-1930s and the defeat of 1940. De Gaulle further reinforced State control through the nationalization of 1945. However, the precise nature of this control and the legal status of the Bank were not defined. The strong economic growth of the '*Trente Glorieuses*' has been widely seen as the result of an economic, financial and monetary policy designed in co-ordinated fashion by the Treasury, the Planning Commission and democratically elected governments. Given the strong republican consensus of the postwar period and that most Bank of France governors were former Treasury officials (and members of the elite Financial Inspectorate), the expression of Bank autonomy – in defiance of the government – was only periodic and rarely public (Bouvier 1988, Koch 1983, Patat and Lutfalla 1986, Prate 1987). As during previous periods, this expression of autonomy depended upon the personalities involved and the degree to which governments diverged from the goal of monetary stability. Governor Olivier Wormser succeeded in clarifying Bank powers in the context of the January 1973 reform which explicitly granted the Bank greater scope to modify its monetary mechanisms. However, the reform in no way diminished State control over monetary policy. The republican bias in favour of a democratic check on the central bank was reinforced by technocratic arguments which stressed the historic dependence of the Bank of France on the Ministry of Finance as the principal source of monetary and economic information. Treasury officials generally believed that the Bank was unable, technically speaking, to take decisions in matters of credit and money (Koch 1983, Mamou 1987).

Most leading French politicians and financial bureaucrats correspondingly believed that economic and monetary policy should not be completely separated for economic reasons: that the latter should be seen as a tool of the former. While the importance of price stability was perceived by a growing proportion of the political class in the 1970s and 1980s, very few believed that it should be considered a goal to be pursued separately from other economic goals. The relations between French governments and the Bank since the middle of the nineteenth century effectively demonstrated this duality. Beneath the different German and French attitudes on central bank independence, there lay two different conceptions of the role of money. According to the German conception, monetary stability was considered to be a categorical imperative of economic and democratic order linked to the maintenance of the rule of law (inflation is a non-voted tax). According to this tradition, citizens have as much right to a stable cur-

rency, as they have a right to the security of their person and their property. In consequence, macroeconomic policy should involve as little manipulation as possible of credit. Such attitudes, as noted in the previous section, are also rooted in the experience of hyperinflation in the interwar period (Marsh 1992). French monetary history was considerably different from that of Germany. Although inflation had repeatedly been a problem both prior to and since the Second World War, the Laval deflation of the mid-1930s was generally perceived to be the most economically disastrous monetary development in the twentieth century (Patat and Lutfalla 1986). The Delors Report – written by central bankers and monetary economists – reflects the German conception. The strongly negative reaction of most leading French politicians and the Treasury to the report reflected the degree to which this conception was alien to the French (Balleix-Banerjee 1997).

The preference of French governments to link the management of economic and monetary policy does not necessarily indicate a limited commitment to low inflationary policies. It has been claimed that French governments have not been preoccupied with inflation as an economic problem but rather have adopted low inflationary policies in order to achieve a competitive advantage in relation to Germany (most notoriously by Connolly (1995)). There has been an historic preoccupation with the competitive position in relation to the major trade partners, in particular the Germans. The drive to cut inflation – under President Giscard d'Estaing in the late 1970s and early 1980s and then the Socialists from 1982 – was linked closely to competition-oriented goals: inflation led to devaluation which only temporarily improved the competitive position of French industry and discouraged necessary structural change. Competitive advantage was sought via the maintenance of a lower level of inflation than France's European partners (notably Germany): thus the policy of '*désinflation competitive*' (Fitoussi 1993). This policy – linked to the avoidance of franc devaluations through the maintenance of relatively high interest rates given the asymmetric operation of the ERM – also forced French companies to become more cost efficient.

It is important to note that different actors have placed different emphasis on the two goals. Most leading French policy-makers sought both. French governments clearly had to balance monetary with other goals. Competitive ambitions – more acceptable to a French political class traditionally sensitive to the commercial balance – were often appealed to as the justification for the high interest rates needed to maintain low inflation. However, most leading Treasury officials

focused principally upon monetary goals, while those in the Bank of France have been singularly preoccupied with the maintenance of low inflation.

French reluctance to accept independent central banks during the discussions and negotiations on EMU and insistence upon '*gouvernement économique*' was also rooted in the belief that 'sound money' economic policies do not rely on independent central banks (Aglietta 1988).[28] French monetary history was presented in order to challenge the numerous Anglo-American econometric and statistical studies which have shown a strong correlation between central bank independence and lower inflation rates. According to these studies, politicians are likely to adopt monetary policies which do not lead to optimal results on inflation because they are motivated by more than just monetary goals (Goodhart 1988 and 1993). Some in France did support these claims, notably leading Bank of France officials who from the period of increased inflation in the late 1960s repeatedly attempted to convince party leaders of the logic behind increased autonomy (Prate 1987). Correspondingly, the Bank presented the argument that independence would increase confidence in the franc, diminish speculation and allow the lowering of interest rates. Such economic arguments had greater political appeal apparently and convinced Jacques Chirac and other RPR leaders of the logic behind independence prior to the 1986 elections when they supported the Pasqua private member's bill (1985) which granted a large degree of autonomy to the Bank of France. Once in power, however, Chirac's position changed. In the face of the determined opposition of his Minister of Finance, Edouard Balladur, and the Treasury, Chirac's own position on the matter was insufficiently strong to lead to a change in policy (Balleix-Banerjee 1997 and Prate 1987).

Posen (1993) argues that political support for low inflation is responsible for both low inflation and central bank independence. He attributes this political support to the influence of a narrow financial or banking interest group. In the French case, this group can be defined as the financial administrative elite consisting of top Treasury officials (members of the elite *grands corps*, the Finance Inspectorate and other corps, and principally those involved in monetary policy-making); Treasury officials in the support staffs of the president, the prime minister and the minister of finance; and top Bank of France officials, notably the governor who has almost always been a member of the Finance Inspectorate and a former Treasury official. In the Treasury, it was also generally believed that the argument linking central bank

independence and inflation did not take into consideration the rationalized French model of monetary and economic policy-making in which a trained financial administrative elite had considerable influence over the formation of policy. Relative French success in controlling inflation during the postwar period – from 1958 to 1968 and from 1978 to the present (with the brief exception of 1981–83) – was achieved with minimal central bank influence over government policy-making. The inflationary tendencies in the French economy were linked to the excessive dependence of French public and private sector companies upon State-allocated credit, not inadequate Bank of France autonomy (Loriaux 1991; Aglietta 1988).[29] Moreover, from 1991, the French succeeded in lowering inflation well below levels in Germany. Given these achievements, French governments and the Treasury were reluctant to surrender control on the grounds that they were prone to excess. The admiration of the German economic model – and its low inflationary economic growth – did not extend to the institutional structure of German monetary policy-making.

The EMU project modified the economic policy-making power structure of the French State rooted largely in the financial administrative elite (Dyson *et al*. 1994). For the Treasury, central bank independence was one in a series of blows to its power, diminished by privatizations, the liberalization of financial markets and EC rules on competition which limited large state aids, previously managed by the Treasury. Ironically, it also could be seen as the result of the victory of the Treasury in its struggles over a 20-year period with neo-Gaullist and Socialist governments to maintain low inflationary policies. EMU was only made possible by the willingness of both governments of the Left and the Right to embrace 'sound money' economic policies.

The loss of this Treasury power due to the 'independence' of the Bank of France was mitigated somewhat by the close links between the Bank's governor, the French financial administrative elite and leading French politicians. Although opposed to the statutory independence of the Bank of France during the discussions and negotiations on EMU in 1990–91, Treasury officials and the Socialist Minister of Finance, Pierre Bérégovoy focused their opposition on the issue of ECB independence. With power over interest rate policy transferred to the European level, it was necessary to extend Treasury control over this policy through the influence of the French Minister of Finance in the context of ECOFIN, and thus to ensure extensive Council control in relation to the ECB.

There were also other reasons for opposition to central bank independence, although these appear to be secondary. Notable among

these was the concern expressed by several politicians and officials – including Bérégovoy – that independence would not lead to a true sharing of policy-making power at the European level (Balleix-Banerjee 1997; Bauchard 1994). Rather it was his belief that independence would further reinforce the dominance of the Bundesbank in the determination of European monetary policy – principally because most of the participating member states were in effect German monetary satellites, or were insufficiently large to challenge German monetary influence. The concern to diminish Bundesbank and maximize French influence in the context of EMU explains in large part the intransigent French insistence upon Italian participation in Stage Three and upon the choice of Bank of France Governor Jean-Claude Trichet as the first president of the ECB. This insistence was not diminished by Trichet's repeated and public displays of autonomy in relation to the demands presented by President Chirac and the Juppé and Jospin governments (Aeschimann and Riché 1996). The hard-won compromise to replace Wim Duisenburg by Trichet after four years was made palatable for the French by the appointment of Christian Noyer – like Trichet, a former head of the French Treasury – as ECB Vice-President.

Given these views, it is not surprising that none of the political parties supported the concept of central bank independence until 1991 (Balleix-Benerjee 1993, 1995, 1997 and 1999). The RPR was opposed for nationalistic reasons (dropping all further discussion of the Balladur memorandum in the campaigns leading to the Presidential and National Assembly elections of 1988) and sought the maintenance of Council control over monetary policy. The Socialist party placed stress on social goals and the appropriate policy mix, although was forced into acquiescence by the Socialist government. Moreover – and surprisingly – Giscard d'Estaing's centre right party confederation, the UDF, supported only a more cautious, evolutionary approach – although one of its more pro-European components came out strongly in favour of central bank independence. Despite this general party opposition or reluctance, French public opinion was generally – albeit vaguely – in favour of the EMU project and the transfer of monetary power to the European level and thus, implicitly, national and European central bank independence.[30]

The French preference to maintain political/Treasury control over monetary policy helps to elucidate the logic behind the development of French negotiating positions on the details of the EMU project – notably the French draft treaty of January 1991 – and likewise the overall negotiation process. During the period following the first meet-

ings of the Delors Committee, Bérégovoy and Treasury officials introduced the idea of '*gouvernement économique*'. In the French draft treaty of January 1991 they insisted:

> Everywhere in the world, central banks in charge of monetary policy are in dialogue with the governments in charge of the rest of economic policy. Ignore the parallelism between economic and monetary matters ... and this could lead to failure.[31]

Moreover, they proposed that the European Council, on the basis of ECOFIN Council reports, define the broad orientations for EMU and the economic policy of the Community. Within these orientations, ECOFIN would co-ordinate the policies of member states and make recommendations to individual governments and the ECB would manage European monetary policy. Bérégovoy and Treasury officials also argued in favour of giving the ministers of economics and finance control over exchange rate policy.[32] Bérégovoy claimed that the French draft treaty did not seek to challenge the independence of the ECB and the pursuit of the goal of price stability – which the Germans would have refused to accept. However, the draft treaty sought to limit the European bank's margin of manoeuvre as much as possible.[33]

The French draft treaty had to respect the basic conclusions of the Rome I European Council which granted independence to the ESCB. Its article 2-3.2 therefore states that the ESCB will neither solicit nor receive the instructions of the Council, the Commission, the European Parliament or the member states. However, this list omits mention of the European Council which elsewhere in the draft treaty (article 4–1) is given the power to define the major orientations of EMU. In addition to appearing self-contradictory, the French project thus seemed to be in direct contradiction with the conclusion of the Rome I Summit which stated that the ESCB would be independent of *all* instruction. The draft treaty also very much reflects Treasury attitudes regarding the goal of price stability and French monetary policy tradition. It maintains a double language in favour of the primacy of monetary stability (article 2-3.1) while giving the European Council and ECOFIN the means to challenge this primacy.

The Germans opposed any such control beyond ensuring that the member states respect the specific convergence criteria they sought to place in the EMU treaty. Several unsuccessful attempts were made to reconcile the French and German approaches to the link between Community institutions and the ECB.[34]

The opposition of Bérégovoy and Treasury officials to central bank independence also explains, in large part, their consideration of the parallel currency approach to EMU and the British proposal of the hard ECU – effectively as a way to delay the move to EMU.[35] Moreover, the French draft treaty provides for a potentially indefinite period of transition to EMU: article 5–9 requires the Heads of Government and State to meet prior to the end of 1996 to determine by *unanimity* the length of a subsequent transition period prior to the final decision on the move to Stage Three. In other words, Bérégovoy and the Treasury sought effectively the same monetary power objective demanded by previous governments: a reinforced European monetary authority to promote the use of the ECU as a means to weaken the mark and promote a more symmetric EMS.

On parliamentary control, Bérégovoy proposed a combined sitting of European and national parliamentary members to confirm the monetary policies pursued by the ECB.[36] However, he did not elaborate in any detail on this control and nothing was included in the draft treaty on the matter. There is reason to doubt Bérégovoy's democratic motives, especially given the tradition of a minimal parliamentary role in domestic monetary policy-making and French reluctance to extend European Parliamentary powers in other areas. Rather it is more likely that he sought allies for his efforts to establish a political control over the ECB.[37] On the Commission's participation in the economic affairs of the Union, the French draft treaty proposal went further than any previous French document in advocating 'an active role' of proposal and recommendation. Again, given French reluctance to increase Commission control in any other policy-making areas, this reflected Bérégovoy's attempt to balance the powers of the ECB.

There is an apparent contradiction between the demands of Bérégovoy and the Treasury on setting monetary policy within an economic policy framework established by elected politicians, on the one hand, and their relatively easy acceptance of the Treaty based economic convergence criteria, on the other, given that the imposition of these criteria would severely constrain the economic policy-making powers of national officials. In other words, Bérégovoy and the Treasury appear to have been more concerned with the elements of formal control than the details of permissible economic policy.

The logic of this apparent contradiction can be explained principally in terms of the degree of the loss of the government's control over policy-making. In principle, the independence of central banks ended most government control over monetary policy, which the French

believed should not be disassociated from economic policy, whereas the convergence criteria only provided limits not to be exceeded by national policy-makers. Moreover, in 1990 and 1991, the French thought that the criteria could easily be respected. Only from 1992 did it become clear that considerably more rigorous economic policies were necessary in order to meet the criteria. During the negotiations, French concern with the criteria reflected more a desire to ensure Spanish and Italian participation in the EMU project in order to balance German monetary power.

It can be argued that Treasury opposition was as much rooted in a desire to avoid losing control over monetary policy as it was in any perception of the link between economic and monetary policy, French institutional tradition or democratic sensitivities. It should, however, be noted that Bérégovoy's position reflected the intensity of opposition to central bank independence in political circles which was only fully expressed during the 1992 referendum campaign. Bérégovoy conceded defeat on the matter, after a prolonged and much publicized outcry, only when the President forced his acquiescence. Treasury was not in a position to damage the project once arranged.[38] Moreover, the political and economic situation of the post-Maastricht period demonstrated that the EMS was not sufficient to ensure monetary stability or low inflationary policies in the context of liberalized capital flows and growing demands to devalue the franc outside the ERM, in order to lessen the economic difficulties created by high German interest rates.

Given the control that he exercised over European policy and his decision to force the acquiescence of Bérégovoy and the Treasury, the President's own position on central bank independence was of considerable importance in determining the development of French policy. There has been some difficulty in understanding the precise development of Mitterrand's stance on central bank independence and the EMU project. In terms of public announcements, it appears that he did not support independence until the end of 1990 when he endorsed the conclusions of the Rome I European Council, which accepted the independence of the ESCB. If his position did change at this point, this suggests the importance of two considerations: first, that German reunification encouraged his willingness to accept German demands on the matter in order to push ahead with EMU (Grant 1994) and second, that after a couple of years of discussions, it was very clear that the Germans would not alter their position on the matter. In any case, Mitterrand continued to allow Bérégovoy and Treasury officials to push for more political control throughout the IGC of 1991.

An alternative perspective on Mitterrand's position on independence comes from the Bank of France governor at the time, Jacques de Larosière, who met with the President in May 1988 and presented the necessary conditions (notably those imposed by the Bundesbank) for the successful conclusion of the EMU negotiations. De Larosière claims that Mitterrand understood and accepted these conditions from the start of the negotiations.[39] However, given the President's decision-making style – his preference to meet his advisers separately and to demonstrate a strong empathy for their position – there is reason to doubt this.[40] It is possible that he understood the nature of German demands and was willing to compromise at the end of the negotiations, but that in the meantime he would allow the Treasury to demand as much political control as possible.

Mitterrand's own position on central bank independence, as on many policy questions, is far from certain. According to both perspectives, the President's willingness to allow Bérégovoy and the Treasury to make their demands was likely rooted in his own personal support for the maintenance of a political control.[41] It is also likely that he used the matter of independence as a bargaining chip in the negotiations in order to secure German agreement on an automatic move to stages two and three. Furthermore, he likely sought to prevent a Treasury revolt on the matter and that he was very sensitive to 'republican' opinion on central bank independence. This sensitivity was most clearly demonstrated in the President's misleading statements during the campaign prior to the September 1992 French referendum on the Maastricht Treaty. On one significant occasion, during a major televised debate on the Treaty, Mitterrand claimed that elected officials would establish the economic policy framework for the formation of monetary policy: an interpretation of the Treaty inconsistent with its actual provisions.[42] Nonetheless, according to both perspectives, Mitterrand was not prepared to allow demands on the maintenance of a political control – from French or other member state officials – to derail the negotiations (Bauchard 1994).

Mitterrand's insistence upon satisfying the German demand for independent central banks in exchange for a fixed date for the start of EMU – despite the impact on the republican model and the structure of power within the French State – perhaps demonstrates the importance that he placed on European power motives. French governments sought to end the independent expression of German – that is, the Bundesbank's – monetary power. They sought to maximize control over domestic monetary and economic policy-making by sharing monetary power at the

European level, as a more acceptable alternative to Bundesbank dominance. Previously, French governments had demanded that German monetary policy incorporate the interests of other EMS member states, notably French interests. Specifically, this meant lowering German interest rates. In the context of the asymmetric operation of the EMS, French governments sought maximum German financial support for the defence of the franc–mark parity and extended monetary assistance to prevent excessive currency fluctuations within the ERM margins. German refusal to create a truly symmetrical EMS – in which strong and weak currency countries were equally responsible for the maintenance of inter-parity stability – led Mitterrand to the conclusion that German power could only be reduced in the context of EMU. The French were also concerned about the international implications of German monetary power. Sharing this power in the context of EMU was deemed the only way to avoid the creation of a tri-polar world of monetary power around Germany, Japan and the United States. Power motives also shaped the perception of other leading politicians of the EMU project. The psychological impact of German reunification, and its perceived strategic impact, further increased the importance of power arguments and thus helped to convince many former sceptics in the Socialist government of the merits of the project, including Prime Minister Michel Rocard and diminish the opposition of some government members, including Bérégovoy himself (Bauchard 1994).[43]

French opposition to central bank independence also explains the negotiation strategy of Commission President, Jacques Delors and Chancellor Kohl. The March 1988 proposal of the German Minister for Foreign Affairs, Genscher, on the creation of a European System of Central Banks (ESCB) stated clearly that central banks would have to be made independent.[44] Delors and Kohl's decision to convene central bankers in the Delors Committee for the initial examination of the project was clever strategy both to overcome Bundesbank reluctance on EMU but also to side-step the inevitable opposition of certain member state governments and treasuries – notably the French – to central bank independence (Dyson 1994). The aim was to accustom governments to independence via the decisions reached by their own central bankers, acting in a personal capacity. The deliberations of the Committee imposed a central banker's bias on the project and shaped future discussions (Ungerer 1993; Østrup 1995). The Delors Report recommended both the independence of national central banks and the ECB, in addition to precise measures on the manner in which this development was to be ensured.

In the negotiations on the ECB, the French succeeded in establishing a certain role for the Council of Ministers – notably with regard to external monetary policy – but had to accept German demands that this role be contained within a tight framework which respected price stability.

French policy on EU Economic Government: the ECB's political interlocutor in European level economic policy co-ordination

The issue of '*gouvernement économique*' ('economic government' (EG)) has been raised by the French more than other Euro-Zone member states: a preoccupation that reflects concerns linked to the traditionally widespread reluctance in France to accept central bank independence. Since the Maastricht Summit, the issue of EG has resurfaced in French political discourse and in French demands at the European level. The Jospin-led Plural Left Government prioritized the reinforcement of economic policy co-ordination among the 11 (12 since the start of 2001) Euro-Zone member states, notably in the context of a new body, the Euro XI (Eurogroup). The term 'economic government' can signify several different things. In general terms, EG is an institutional set up at the European level that is designed to establish some form of macroeconomic policy, be it only economic policy co-ordination, that has direct impact upon the member states. This is a form of collective governance (Wallace 2000; 541*ff.*) 'among core actors from several institutions and bodies in a multi-faceted network which is constituted by mutual participation patterns' that can be called horizontal fusion (Wessels and Linsenmann 2001).

There is then disagreement about what EG should amount to, both in France and in all the Euro-Zone member states and various proponents of the idea are frequently not very clear about their preferred version. Pierre Bérégovoy, worried about central bankers dominating the discussions over the shape of the future EMU project, raised the need for a political counter power to the ECB in order to achieve an appropriate policy mix at the EU level. At the time of the December 1996 Dublin European Council, the then Prime Minister Alain Juppé claimed that he had secured general agreement to create a 'Euro-Council' – consisting of Euro-Zone ministers of finance – which would form the core of 'economic government', a reinforced economic policy co-ordination among the Euro-Zone government and an improved dialogue with the ECB. The French Socialists made 'economic government' a central element of their policy on EMU during the campaign prior to the June 1997 National Assembly elections. They had been rad-

icalized in opposition, during the recession of the early- to mid-1990s which was blamed widely on the high interest rates required to keep the franc in the ERM and the cut backs required to meet the deficit convergence criterion. The Socialists' joint election manifesto with their Plural Left coalition partners pulled them further to the left. They forwarded European 'economic government' as a means to promote growth and employment, goals which were ostensibly given equal weight to the 'growth and stability' goals in the Amsterdam Treaty due to Jospin's insistence on parallel resolutions. Rhetorically, the building of EG was linked to the establishment of a 'euro-social': an EU-level economic and monetary policy mix that would counterbalance the 'sound money' policies pursued by the ECB. Socialist Finance Minister Dominique Strauss Kahn succeeded in achieving a more formal agreement on the creation of what he labelled the 'Euro-Council' (*conseil de l'euro*) in December 1997 which the Jospin Government widely presented as a manifestation of 'economic government'. This body was subsequently relabelled the Euro-X due to German opposition that the label Council incorrectly suggested that this new body had legal status. This body became the Euro-XI following the determination of the number of member states participating in EMU and was subsequently officially relabelled the Eurogroup during the French Council presidency during the second half of 2000. Leading French officials also claimed that the creation of the new Economics and Financial Committee, the rebaptized Monetary Committee, helped to reinforce the control of the Euro-XI over the economic framework in which monetary policy was made, and thus was a step closer towards the creation of 'economic government'.[45]

What different French politicians mean exactly when they espouse EG has often been unclear. Nonetheless, different governments – indeed different policy-makers – place different emphasis on different kinds of co-ordination and the appropriate role to be fulfilled by the Eurogroup. There are at least five understandings of 'economic government' that can be discerned from French policy statements, each having a potentially different impact on the role of the ECB in the co-ordination process.

1. EG as co-ordination of macroeconomic policies to achieve greater stability – to support fiscal policy co-ordination (which is supposed to involve binding rules and even fines). In this sense EG contributes to the construction of the 'stabilization state' (Dyson 2000). This reinforces the primary objective of the ECB and

promotes a positive co-ordination role between ECOFIN and the ECB – which was also charged with promoting convergence. EG as stabilization has involved the 'hard' co-ordination of the convergence criteria rules (with rules for the imposition of fines established in the Stability Pact) and the mutual surveillance of national macroeconomic policies begun in Stage One of EMU in 1990, which was reinforced by the Maastricht Treaty and the Stability Pact requiring member states to prepare and submit medium term stabilization reports (Broad Economic Policy Guidelines).

2. EG as co-ordination of macroeconomic policy to achieve a good policy mix aims to promote a more activist co-ordinated policy of member state governments to increase economic growth and create employment. This is about qualifying/counterbalancing the drive for monetary stability by achieving an 'appropriate' policy mix. This form of EG can involve a positive co-ordination between the Council and the ECB – which also has for goals the promotion of employment and investment in the Euro-Zone – as long as the Council places clear limits on its pursuit of improved economic growth and this does not become inflationary.
3. The third version of EG that can be discerned in French government policy speeches is more interventionist involving EU job creation strategies and programmes. This could involve varying degrees of intervention in the context of the EU's employment and social chapters or in terms of EU sponsored investment.
4. EG has also been perceived and advocated in a fourth way – notably as a means to improve the credibility of ECB monetary policy. In large part this links in with the first version (EG as stabilization). But this is also crucially about communication – the co-ordination of government voice regarding ECB monetary policy and desirable economic policy. As shown in Chapter 6, there is a problem of many voices making different pronouncements on ECB policy-making (notably German Chancellor Schröder on the positive aspects of a weaker euro in September 2000 and several public criticisms of ECB management, etc.) which in turn can be blamed for contributing to the weakening of the euro. This version of EG involves the creation of a clear political interlocutor of the ECB, which focuses on maintaining good relations with the ECB. This would also – as noted in Chapter 3 – contribute to the improved co-ordination of the international representation of the Euro-Zone. The Eurogroup would play this role.

5. This is linked to a fifth version of EG (which is compatible with all the previous versions with the exception of the third) which involves embedding the independent ECB in a political framework: to reinforce its democratic legitimacy and public accountability. This version provides a partial response to those who express concern for the problematic existence of a single currency without a single state (see Chapter 4).

Initially, in the discussions and negotiations on EMU in the late 1980s and early 1990s, French use of the term 'economic government' was linked closely with the need for an effective policy mix (the second version mentioned above). Such a policy mix would be impossible to achieve with one monetary policy and several varying economic policies, potentially going in different directions and not responding in a co-ordinated manner to asymmetric shocks in the Euro-Zone. Rules on fiscal policy were not enough to ensure effective co-ordination (as the Irish case of early 2001 demonstrates). Other governments (notably the German and the British) feared that the French Socialist government of the day had too Keynesian a vision of appropriate policy mix and intervention that would undermine the stabilization goals of the ECB. The Plural Left Government's rhetoric (notably that of certain government ministers including Prime Minister Jospin himself and the powerful Social Affairs Minister Martine Aubry) emphasized a much more interventionist EG linked closely to an activist EU employment policy. However, the Jospin Government's preferences in this area were not met: the Employment Chapter of the Amsterdam Treaty, the Luxembourg and Cardiff Jobs Summits of November 1997 and March 1998, and the Cologne and Lisbon Summits of June 1999 and March 2000 established a non-binding 'soft' or 'open' form of co-ordination that fell far short of the kind of intervention sought by the French.[46] Nonetheless, EU employment policy served its legitimizing purpose at the domestic political level and French Socialist ministers consistently stressed – if not exaggerated – the significance of developments in this area.[47]

Interventionist Jospin Government rhetoric effectively damned the term 'economic government' in the eyes of several other EU governments, which largely explains why the term was largely absent from French government rhetoric during the French Council Presidency of the second half of 2000 (although the state-sponsored studies on EG produced in the lead up to and during the Council Presidency used the term quite freely). Nonetheless, the discourse of Jospin, the Socialist

Minister of Finance Laurent Fabius and President Chirac regarding the role of the Euro-XI and economic policy co-ordination continued to focus on all versions/logics of EG with the exception of the more interventionist third.

In order to strengthen its hand in discussions with its EU partners, in 1998 the Jospin Government created a group of the French Planning Commission to examine possible scenarios of improved economic policy co-ordination in the Euro-Zone. The group was led by Robert Boyer, a leading academic critic of the lack of economic policy co-ordination at the European level (see Boyer 1999), and the group's May 1998 Report demonstrated both the problems of increased co-ordination and the potential paths for co-ordination. Furthermore, Jospin called upon the Council for Economic Analysis linked to the Prime Minister's office to examine economic government and to produce a report at the start of the French Council Presidency, to provide the intellectual backing for the project. The report by Pierre Jacquet argues that economic growth over the upcoming decade would be considerably lower without tightened co-ordination and the European partners would not be able to meet their goal of 'full employment' by 2010 (set by the March 2000 Lisbon European Council).[48]

In his June 2000 speech before the German Bundestag, President Chirac called for improved economic policy co-ordination and a stronger Euro-XI as a key component of his vision of a 'pioneer group' needed to make EMU work. The French Council Presidency thus had two specific goals: improve the visibility of the Euro-XI and improve economic policy co-ordination. Progress in both goals was limited during the French presidency but potentially significant. Regarding the first goal, the Jospin Government had unsuccessfully sought to give the Euro-XI a legal personality of its own. Thus all Euro-XI agreements had still to be ratified by ECOFIN. The Germans insisted that the commonly used label 'Euro-Council' be dropped. Also, ECOFIN remained very much the most important body for co-ordination (including discussion of the stabilization plans which were also prepared by the four ESCB members not participating in the Euro-Zone). Nonetheless, the French scored a minor victory in convincing the Euro-Zone governments to relabel the Euro-XI the Eurogroup. The French also succeeded in bringing an agreement to produce a clearer, published agenda for Eurogroup meetings, to have longer meetings, to discuss more current matters at them and to improve their communication output (notably through the organization of a press conference immediately after the Eurogroup meeting, prior to the ECOFIN the following day). This was

very significant because it gave the Eurogroup the opportunity to make policy announcements prior to their confirmation by all EU finance ministers in ECOFIN, effectively turning ECOFIN into a subsidiary body. With regard to Eurogroup–ECB relations, Laurent Fabius, unsuccessfully, sought the organization of more frequent bilateral meetings between the presidents of the two bodies. The aim here was to improve the co-ordination of member state positions on ECB policy-making and channel this through the Eurogroup to the ECB president. Fabius also blamed the weakness of the euro on the lack of strong political leadership in the Euro-Zone, the absence of an EU equivalent to the American Secretary of the Treasury.[49] He raised the idea of a Mr. Euro – previously introduced by the French – to be held by an individual over a period of several years and responsible, in conjunction with the Council presidency, for the international representation of the Euro-Zone (an economic policy equivalent to the Mr. CFSP, the EU's foreign policy representative). The campaign for a Mr. Euro by the end of 2001 was intensified by the Belgian Eurogroup President – although to little avail.

With regard to the second goal of the French Council Presidency, some progress was achieved when the Euro-Zone finance ministers reached an unbinding agreement to improve the co-ordination of economic policies and statements on the major economic issues of the day and of member state analyses of economic developments in the Euro-Zone. The official French aim was to improve the co-ordination of these analyses with the policy 'map' being developed by the ECB in order to give clearer signals to financial analysts. However, the Eurogroup's communication problem arguably worsened during the French Council Presidency – notably the different views on the decline of the euro and attacks on Duisenberg's competence as ECB president – contributing to the general state of disorder fanned by inappropriate policy statements emanating from the ECB (see Chapter 6). This version of 'economic government' as confidence booster still has many growing pains to endure. Another perceived co-ordination problem of the Eurogroup concerned its failure to be more active in intervening and reaching agreements with the United States and Japan to boost the euro – using the new Article 109 provisions on exchange rate interventions agreed the Amsterdam Summit.

Despite the efforts of French and other governments there have not been great strides towards tightened co-ordination. The Eurogroup is clearly more visible than the Euro-XI and is discussing a wider range of problems, which contributes to the development of the fourth and

fifth versions of 'economic government' and the legitimization of the ECB. However, some – principally Anglo-American – observers argue that there is a very real risk that the Eurogroup is not performing its core task successfully enough, that is ensuring stability: the first version of economic government. Peer pressure in the Eurogroup has failed to prevent delays to major structural reforms in several countries, including France. This in turn places the ECB in the spotlight – along with the Commission – as the main watchdog of price stability in the Euro-Zone. However, this stabilization goal of 'economic government' was clearly not prioritized by the Jospin Government – despite the constant assurances of Socialist finance ministers to their Euro-Zone counterparts and the international financial markets – and President Chirac's own election campaign rhetoric of the first half of 2002 suggested that the achievement of the stabilization goals of the French medium-term programme could be delayed three years (2004 to 2007) to allow for tax cuts and increased government spending.

The United Kingdom, central bank independence and the EMU project

The Attlee Government nationalized the Bank of England in March 1946 as one of its first acts. Opposition to central bank independence soon became wide-spread across the ideological spectrum and well-entrenched. As in France, government control over monetary policy was seen as necessary for economic reasons – a manifestation of the Keynesian consensus – and political reasons – democratic control, with focus in Britain upon the doctrine of parliamentary sovereignty (Busch 1994; Cairncross 1988). Monetary policy, it was frequently argued, was not to be left to 'unelected bankers' but rather democratically elected governments should maintain their control. The Bank of England between 1946 and 1997 has been ranked as one of the most dependent on government (Busch 1994; Elgie and Thompson 1998). Busch (1994) explains the comparatively well-entrenched opposition to independence also in terms of the high degree of centralization and concentration of power in territorial, institutional and political terms (the regularity of single-party majority governments).

It is thus understandable why, even though the British record on inflation was very poor,[50] central bank independence was rarely presented as a solution to the problem by either Labour or Conservative governments. Indeed, Britain was affected far more than France by high inflation in the 1970s. The shift in governing economic policies

towards 'sound money' was initially imposed by outside sources: principally, the International Monetary Fund, of which Britain had been by far the largest borrower of balance of payments facilities, which imposed tighter conditionality, and pressure from the US Treasury department. 'Sound money' arrived in force as part of the revival of monetarism and neo-liberalism under the Conservatives that went much further than any other West European country. Nonetheless, the Thatcher and Major Governments of the 1980s and 1990s – which embraced monetarism, of which central bank independence is a central tenet, and New Public Management reforms, creating quasi-autonomous organizations to manage a wide variety of policy areas – refused to accept granting central bank independence, despite growing support for independence in the City. At least two chancellors of the exchequer proposed independence. Nigel Lawson did so in November 1988 (revealed only in his resignation speech in the House of Commons on 31 October 1989) but was refused by Margaret Thatcher, who subsequently argued that this would have been 'seen as an abdication by the Chancellor when he is at his most vulnerable' (Thatcher 1993: 706). Following his departure from the Chancellor's office in September 1992, Norman Lamont claimed that he had tried unsuccessfully for two years to convince Prime Minister John Major of the benefits of an independent Bank of England. When the Delors Committee proposed independent central banks – a move clearly supported by Bank of England Governor Leigh-Pemberton – there was very little public political backing in the United Kingdom.

The opposition of Thatcher and Major to EMU was only partly based on the requirement of central bank independence (see Blair 2002). The transfer of monetary policy-making power to the European level was the much more important cause for concern. During the 1993 debate on EMU and the ratification of the Maastricht Treaty, the issue of independence was raised more as a reason for opposing European monetary integration and very few Members of Parliament (MPs) supported independence. There remained some confusion about the impact of the British opt-out of Stage Three of the EMU project upon central bank independence which was required as part of the second stage, in which the British were supposed to be participating. However, in January 1993, Prime Minister Major reaffirmed the continued opposition of his government to independence (the *Financial Times*, 23 July 1993). A 1993 private member's bill on Bank of England independence was rejected by the government majority and a substantial number of opposition MPs (Marcussen 2000: 255–6).

Most left-wing opponents criticized European monetary integration, central bank independence and 'sound money' principles on the grounds that they conformed with the dominant monetarism of the day, while independence involved unacceptable forms of accountability and gave 'narrow minded' central bankers excessive power. Much of the opposition to central bank independence was linked with the broader xenophobic opposition to EMU, including fear of German domination and the problematic trustworthiness of the Mediterranean member states in money matters, in addition to more general – widespread – opposition to further European integration. The opposition MPs who supported the private member's bill did so for three reasons (Marcussen 2000: 254–5): to enable the Bank of England to participate fully in the ESCB and thus enhance British influence in the EU; to redefine the manner in which the concept of 'political accountability' had traditionally been defined in Britain; and, on economic grounds, to improve inflation performance and the operation of the single market.

Given the widespread hostility in the Labour Party to central bank independence, most observers were very surprised when – only a few days after the May 1997 election – the new Labour Government's Chancellor of the Exchequer, Gordon Brown, announced the decision to grant 'operational independence' to the Bank of England and the creation of the Monetary Policy Committee (MPC) as the Bank's decision-making body. This was justified in terms of providing monetary stability, presented as a pre-condition for improved economic performance. As noted in Chapter 1, Marcussen (2000) explains the move to independence in Britain (as well as the other EU countries not participating in the EMU, Denmark and Sweden) in terms of the ideational coercion of EU policy elites. Entrenching causal ideas about the positive relationship between central bank independence and low inflation in the Maastricht Treaty made it increasingly 'illegitimate' to deviate from this norm. The British Labour Government was also able to place the move to independence in the context of its broader constitutional reform package: independence was presented in terms of modernizing an 'old-fashioned' system. The justifications for reform thus tended to differ from the pro-independence arguments presented in 1993 (Marcussen 2000: 258–63). Crucially, independence was not justified with reference to European monetary integration: it was necessary in itself, not as a stepping-stone to British participation in EMU.

The reluctance of British governments to participate in European exchange rate mechanisms (the Snake of the 1970s and the ERM of the

EMS) and the highly negative experience – in both economic and political terms – of participation (forced removal from the Snake in 1973 and the ERM in September 1992) can be seen as both relating to opposition to central bank independence as well as reinforcing this opposition. The reluctance stemmed in large part from the unwillingness of British governments to restrict their margin of manoeuvre in monetary and macroeconomic policy-making. The monetarism of the 1980s also prohibited exchange rate targeting (although Nigel Lawson secretly/unofficially shadowed the deutsche mark and sought to keep the pound within the fluctuation margins of the ERM for most of the 1980s, he subsequently justified doing so in order to reinforce the pursuit of low inflation in Britain). British non-participation also weakened the role of British central bank governors, who did not participate in the co-ordination exercises of their European counterparts. Non-participation also decreased the likelihood that British governments would accept the reinforcement of central banking power and participate in EMU.

Does the move to Bank of England 'operational independence' suggest that the Prime Minister is determined to push ahead with his plan to hold a national referendum on British participation in EMU? This – in the final months of 2002 – remains far from certain. The decision not to announce a referendum following the June 2001 national election surprised many observers and the continued opposition of a solid majority of British voters to EMU and strong divisions in the Labour cabinet – with Euro-sceptics in the ascendant – may delay a referendum for several years to come. However, it is not the purpose of this brief presentation of British attitudes on central banking and monetary policy to analyse the debate on EMU in broader terms. The crucial question here is whether or not Bank of England 'operational independence' – and we can add the widely proclaimed success of the Bank's MPC in managing monetary policy – has helped to change the views of Euro-sceptic British politicians and public opinion and accept the transfer of monetary power to the ECB? The answer to this question is almost certainly no. Opposition to EMU is rooted in much more than attitudes on central bank independence. Moreover, we should also add that there is a crucial difference between Bank of England operational independence and ECB independence: in Britain, governments set the inflation target that the Monetary Policy Committee must attain by manipulating the short term level of interest rates. If the MPC does not attain the target, the government is entitled to replace its members. In this sense the MPC is more like the governing

body of the Bank of New Zealand or, in some respects, the executive board of a 'quango'. That the British government continues to determine the desirable rate of inflation – at least in official legal terms, however restricted it is in terms of how it uses this power – can be said to conform to the British tradition of parliamentary sovereignty (Busch 1994). The Governing Council of the ECB, on the contrary, sets its own inflation target. The 2 per cent figure that it has decided upon has been challenged by many British observers as being excessively restrictive (the current Bank of England target is 2.5 per cent) and likely to hinder economic growth in the Euro-Zone in up-coming years (and unlikely to be met thus weakening the bank's credibility). However, it is impossible for governments to change this figure (and problematic for them to argue in favour of doing so, given the potential impact upon ECB credibility). Given the important difference in the political control over the two institutions it is not surprising that many British politicians, journalists and even members of the Bank of England's MPC have been critical of the ECB's institutional structure. One MPC member, Willem Buiter (1999), has criticized the ECB for being undemocratic, unaccountable and lacking in transparency.

Moreover, well-informed British opposition to EMU has long focused on the difficulty of adopting a single Euro-Zone monetary policy that best meets the economic needs of a dozen different member states. The first three years of the operation of EMU – with strong divergence in economic growth and national inflation rates and the widespread criticism of the ECB's refusal to cut interest rates as rapidly as the Bank of England – have largely reinforced this concern (see Chapter 6). Many politicians and commentators argue that the ECB's pursuit of the narrow inflation target is inappropriate given the diversity of the Euro-Zone national economies. The Blair Government has embraced five economic conditions that need to be satisfied before it will hold a referendum on EMU participation. Most observers agree that the difficulty of determining whether or not Britain has met these conditions makes the future decision on a referendum principally a political one. However, some (see for example, *The Guardian,* 28 January 2002) have also argued that ECB reform should be incorporated into this list of conditions. It is argued that without reform that allows greater flexibility in ECB monetary policy-making, Britain and other member states will not be able to 'live comfortably with euro interest rates on a permanent basis', one of the five conditions. Many British and foreign observers thus hold up the post-1997 Bank of England as the model for ECB reform.

It was also unsurprising when on 23 January 2002, Pascal Lamy, the Socialist French commissioner for trade and Jean Pisani-Ferry, Prime Minister Jospin's economic adviser, published (in a 'personal capacity') a pamphlet echoing British concerns about the structure and monetary policy-making of the ECB (*L'Europe que nous voulons*, 2002).[51] In their pamphlet, Lamy and Pisani-Ferry argued for what could be described as a sixth form of 'economic government': that the ECB should imitate the practice of the Bank of England in following a less constraining monetary policy set by government (2–3 per cent as opposed to the ECB's 1–2 per cent) and being less secretive. They also noted that ECB's structure had been determined by the need to reassure the German public that it would be as tough on inflation as the Bundesbank. The changed economic conditions – especially in Germany – required a different approach to monetary policy. Only reform along British lines would enable a more flexible monetary policy that could better respond to the economic downturn in most of the Euro-Zone. However, for the moment, it appeared unlikely that a German government – even Social-Democratic led government – was prepared to reconsider the original cornerstone upon which EMU was established – ECB autonomy and the singular pursuit of monetary stability.

Conclusion

In this chapter we have attempted to explain the complicated interrelationship between dominant national attitudes on central bank independence and attitudes regarding the structure, roles and powers of the ECB and the operation of the Euro-Zone in which the ECB must operate. The Germans dictated so much of the structure, roles and powers of the ECB, to replicate to a large degree the Bundesbank and the German monetary policy-making tradition at the European level in exchange for the loss of a national central bank and currency that had been the envy of much of the world and the model upheld by adherents to the 'sound money consensus'. President Mitterrand accepted the German design despite the strong reservations of his government and Treasury. However, French efforts since the Maastricht Summit have focused upon developing an EU-level 'economic government' to ensure an 'effective' dialogue between political leaders and the ECB, although to achieve what precise goal remains unclear. We have demonstrated that the use of the term 'economic government' in French government discourse has shifted over the years and varies depending upon the proponent. The dominant versions of EG appear

to have shifted from those emphasizing a political counter-weight designed to qualify the 'sound money' bias of the EMU project and the ECB, to those emphasizing the Eurogroup–ECB partnership in the process of stabilization and the building of European monetary policy credibility. It is with this aim, that the German government and ECB Executive Board members have increased their support for a reinforcement of EU-level economic policy co-ordination.

Opposition to central bank independence in the United Kingdom was less easily overridden than in France, where the pursuit of monetary policy power and other objectives through the EMU project outweighed national policy-making tradition. The move to Bank of England 'operational independence' in 1997 and the widely proclaimed success of the MPC in managing British monetary policy are unlikely to contribute to a shift in elite and public attitudes in the United Kingdom on the transfer of monetary power to the ECB, especially given the distinct differences between the Bank of England and ECB models. However, in this context, the January 2002 pamphlet by Pascal Lamy and Jean Pisani-Ferry – setting the Bank of England as the example to follow and thus encouraging British entry into the fray – presents an interesting twist in the on-going Franco-German debate about the ECB and its relationship to political authority.

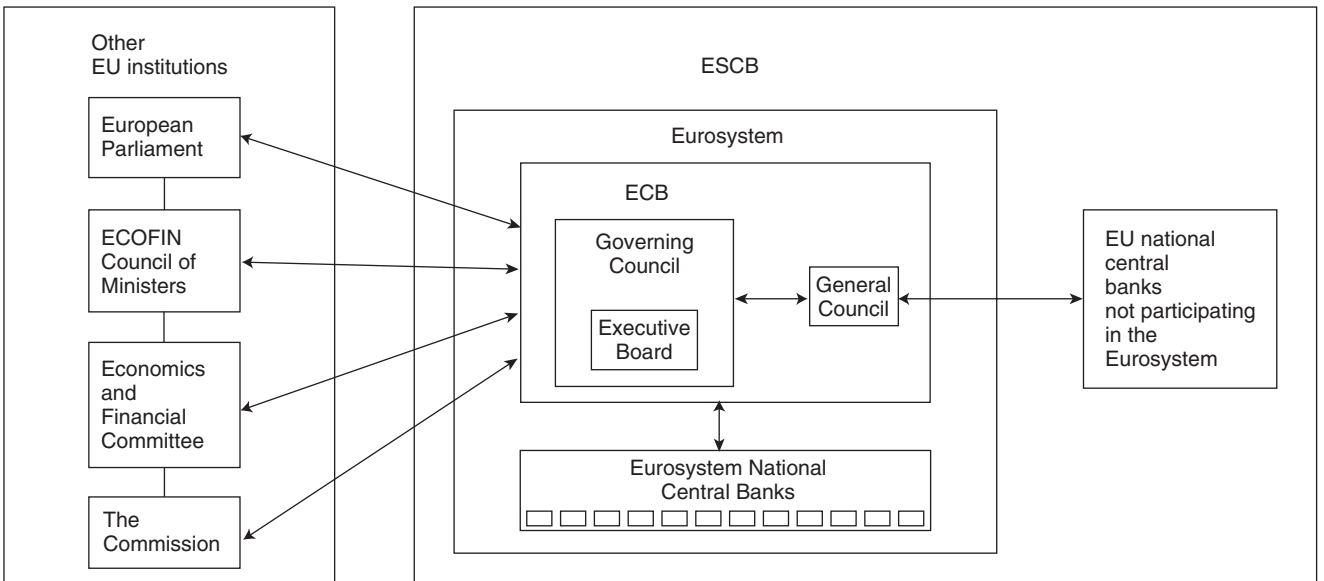
4

Managing Europe's Money: the Organization, Powers and Functions of the ECB

Introduction

The aim of this chapter is to provide a brief overview of the organization – including voting procedures – powers and functions of the ECB and the organization of the ESCB. We also take the opportunity to explore some of the main issues of concern and debate regarding the operation of the ECB and its relationship with other institutions, although we discuss the larger issues of the bank's independence and problematic legitimacy in the following chapter. Despite the ECB's statutory independence, our 'Leviathan' must operate as part of a constantly developing and controversial EMU 'regime' that has a substantial impact on the bank's activities. One issue of debate concerns the role of the ECB over prudential supervision. The ECB argues in favour of transferring control over prudential supervision to NCBs on the grounds that, as part of the Eurosystem, the NCBs are more likely to be effective supervisors of banks which operate in an EU-wide/international market. We also examine the developing and often unclear role of the ECB in the context of four levels of co-ordination. The first is within the Eurosystem and the respective roles of the ECB and NCBs in the management of Europe's money. The second level is in relation to other EU institutions, notably in the context of the 'soft' macroeconomic policy co-ordination managed by the Council of Ministers (the Eurogroup) and the co-ordination with the Council on external monetary policy. The third level is with other EU NCBs participating in the ERMII. Finally, there has been much disagreement regarding the co-ordination of the external representation of the Euro-Zone and the role of the ECB in international level cooperation.

Figure 4.1 The European System of Central Banks: ESCB structure



Composition (see Table 4.1)

The ECB consists of two main decision-making bodies: the Executive Board and the Governing Council. The Executive Board comprises the President, the Vice-President and four other monetary policy and banking experts.[52] They are appointed for non-renewable eight-year terms by the European Council on the recommendation of the Council of Ministers after it has consulted the European Parliament and the Governing Council of the ECB (the Council of the European Monetary Institute (EMI) for the first appointments in 1998) (Articles 11 and 50, ESCB Statute). The first Executive Board members (with the exception of the President) were given terms of different length so that future members can be given staggered terms in order to ensure the continuity of policy-making. According to the Treaty, the Executive Board is appointed on the grounds of recognized standing and professional experience in monetary or banking matters (Art. 109a, Art 112 EC). Officially, Board members, like European Commissioners and European Court of Justice judges (etc.) are not supposed to represent the participating Member States. However – as the designation of the first Board in May 1998 demonstrated – some governments have placed great emphasis on the inclusion of a member from their country and five of the six original members were citizens of the most populous participating member states with the largest economies (German, France, Italy and Spain).

The Governing Council comprises of all the members of the Executive Board and the 'Eurosystem' NCB governors – that is of those EU member states which participate in the Euro-Zone (12 following the accession of Greece on 1 January 2001). NCB governors are appointed by governments for minimum renewable terms of five years. Like the Executive Board, most decision making in the Governing Council takes place, officially, on the basis of simple majority voting. Each member possesses one vote, including the NCB governors regardless of the population and GNP of their member state. In the event of a tie, the President casts the deciding ballot. However, so far, decision-making has been based on consensus and no voting has taken place. Qualified majority voting is used on most matters concerning the ECB's capital. Votes in the Council are weighted according to the national central banks' subscribed capital in the ECB (the NCBs are the only shareholders in the ECB) and Executive Board members possess no votes (Art. 10.3). NCB subscriptions to ECB capital will depend on a formula, the weights of which reflect national shares in the population and gross national product (GNP) of the entire Euro-Zone

(articles 28, 29, 32, 33 ESCB Statute). A third voting system – a qualified majority vote of two-thirds (of the votes cast, each member possessing one vote) – is used to adopt the use of new operational methods of monetary control. The President of the Council of Economic and Finance Ministers (ECOFIN) (the Minister of Finance of the member state holding the EU Council Presidency) and a member of the Commission attend the Governing Council and can submit motions to it (Art. 113(3) (ex 109b) EC). However, they have no voting rights. The Governing Council meets normally in Frankfurt roughly every second week on alternate Thursdays (normally twice a month and at least 10 times a year). However, the President or three members of the Governing Council can call a meeting at any time. It was agreed in 1999, that starting in the year 2000 two scheduled meetings each year would be held in a venue in another member state of the Euro-Zone. Several meetings of the General Council have also been organized as teleconferences. Press conferences are held after the first meeting of every month.

The ECB is at the summit of the European System of Central Banks (ESCB), created by the TEU, which consists of the NCBs of *all* 15 EU member states (including those not participating in the Euro-Zone). The governors of the non-participants – currently Britain, Denmark and Sweden – are not entitled to take part in decision-making on the single monetary policy. During the 1991 IGC, the British and Danish governments, anticipating that they would not initially participate in EMU, sought to include all EU NCB governors in the deliberations of the Governing Council even if those from countries not participating in the Eurosystem were not entitled to vote. However, most other governments insisted that non-participants be excluded. The compromise reached involved the creation of a third body, the General Council, to deal with matters concerning the entire ESCB, and thus consist of all ESCB (EU) central banks governors in addition to the President and Vice-President of the ECB.[53] Voting in the General Council also takes place according to simple majority with each member possessing one vote. The four other members of the Executive Board (in addition to the President and Vice-President) are entitled to attend meetings of the General Council, although they have no voting rights. General Councils are held once a quarter on the same days as Governing Council meetings.

The ECB administrative and operational staff is divided into nine directorate generals (DGs): administration and personnel; legal services; information systems; statistics; operations; economics; research; international and European relations; and payment systems. The DGs fall under the

responsibility of one of the five members of the Executive Board other than the President. They are further subdivided into either directorates and then divisions or simply divisions. Several directorates stand on their own outside the framework of the directorate generals (for example, prudential supervision, banknotes, and controlling and organization). A total of 770 policy staff from the 15 Member States of the ESCB – including those not participating in EMU – work for the ECB. There are currently over 50,000 employees working in the 12 Eurosystem NCBs. This imbalance suggests the ECB's considerable operational reliance upon the NCBs, an issue discussed below in the context of ECB–NCB relations. The ECB also has working groups (on matters including forecasting and econometric modelling) consisting of experts from the NCBs and the ECB, and committees (notably on monetary policy and international relations) consisting of heads of departments from the NCBs and the ECB.

Powers and functions

Prior to exploring the powers of the ECB it is important to note that it is – like the rest of the NCBs participating in the Eurosystem – an independent institution. The issue of independence is discussed in the following chapter. Here it is helpful to quote article 107 of the TEU (108 EC):

> When exercising the powers and carrying out the tasks and duties conferred upon them by this Treaty and the Statute of the ESCB, neither the ECB, nor a national central bank, nor any members of their decision making bodies shall seek or take instructions from Community institutions or bodies, from any government of a Member State or from any other body. The Community institutions and bodies and governments of the Member States undertake to respect this principle and not to seek to influence the members of the decision making bodies of the ECB or of the national central banks in the performance of their tasks.

The basic power of the ECB is to define and implement the monetary policy of the Euro-Zone. According to the TEU and the Statute of the ESCB and of the ECB '[t]he primary objective of the Eurosystem [is] to maintain price stability. Without prejudice to [this] objective, the ESCB shall support the general economic policies in the Community and act in accordance with the principles of an open market economy with free competition, favouring an efficient allocation of resources' (Art. 105). The general economic policies of the Community include:

Table 4.1 Current members of the ECB Governing Council (as of 1 July 2001)

Executive Board members and responsibilities
Willem F. Duisenberg (The Netherlands),
President of the ECB: Directorates Communications, Secretariat and Language Services, Internal Audit.
Christian Noyer (France)/Lucas Papademos (Greece) (from 31 May 2002),
Vice-President of the ECB: DGs Administration, Legal Services, Directorate Planning and Controlling.
Eugenio Domingo Solans (Spain),
DGs Information Systems, Statistics, Directorate Banknotes.
Sirkka Hämäläinen (Finland),
DG Operations, Payment Systems, Risk Management.
Otmar Issing (Germany),
Chief ECB economist: DGs Research, Economics.
Tommaso Padoa-Schioppa (Italy),
DGs International and European Relations, Prudential Supervision. ECB Permanent Representation in Washington, DC.

National Central Bank Governors
Jaime Caruana (Spain)
Antonio Fazio (Italy)
Klaus Liebscher (Austria)
Lucas D. Papademos (Greece)/Nicholas C. Garganas (from May 2002)
Yves Mersch (Luxembourg)
Maurice O'Connell (Ireland)/John Hurley (from Feburary 2002)
Guy Quaden (Belgium)
Vitor Manuel Ribeiro Constâncio (Portugal)
Jean-Claude Trichet (France)
Nout Wellink (Netherlands)
Ernst Welteke (Germany)
Matti Vanhala (Finland)

'… balanced development of economic activities, sustainable and non-inflationary growth respecting the environment, a high degree of convergence of economic performance, a high level of employment and of social protection, the raising of the standard of living and quality of life, and economic and social cohesion' (TEU, Article 2). These goals are cited at the start of the ESCB statute and in so far as price stability is not put at risk, the ESCB *must* take them into consideration when formulating monetary policy. The Executive Board of the ECB implements monetary policy in accordance with the guidelines and decisions laid down by the Governing Council and, in doing so, gives necessary instructions to the NCBs. The Executive Board also executes those powers which have been delegated to it by the Governing Council.

The Statute (principally Article 3) sets out the tasks of the ESCB. Some of these are explored in the previous chapter given the debates during the discussions and negotiations on the ESCB design in the 1988–91 period. Several of these tasks are also discussed in greater detail below.[54]

1. To define and implement the monetary policy of the Community.
2. To conduct foreign exchange operations consistent with the provisions of Article 109 of the TEU.
3. To hold and manage the official foreign reserves of the member states.
4. To promote the smooth operation of payment systems.
5. To contribute to the smooth conduct of policies pursued by the competent authorities relating to the prudential supervision of credit institutions and the stability of the financial system.

Although the ECB does not possess a general power to make regulations, it can do so to the extent necessary to implement specific tasks (Art. 110(1) (ex 108a(1)) EC), notably with regard to the operation of the ESCB (see Craig 1999). Some of the ECB's regulatory power also depends upon what the Council of Ministers grants to it (for example, regarding the establishment of the minimum and maximum reserves to be held by national credit institutions with the ECB). The ECB possesses the limited power to impose fines or periodic penalty payments for failure to comply with obligations contained in its regulations and decisions (Art. 110(3) (ex 108a(3)) EC); notably, with regard to the reserves which credit institutions should hold with the ECB and the prudential supervision of credit institutions.[55] However, it remains the power of the Council of Ministers to establish first the rules. While the possibility exists for the ECB to be taken to the European Court of Justice (ECJ) or Court of First Instance (CFI) on matters pertaining to its management of the ESCB (Craig 1999; Zilioli and Selmayr 2001), the ECB can itself have recourse to the courts (as stated in Article 230(3) (ex 173(3)) EC) in particular with regard to inter-institutional disputes – for example, if the Council fails to consult the ECB on matters where it is expected to do so.

The Governing Council specifically has several responsibilities. It formulates the monetary policy of the Eurosystem 'including, as appropriate, decisions relating to intermediate monetary objectives, key interest rates and the supply of reserves in the [Eurosystem] and shall establish

the necessary guidelines for their implementation' (Article 12.1 ESCB Statute). Thus the Governing Council has the exclusive right to authorize the issue of bank notes in Eurosystem countries, although the notes themselves may be issued by either the ECB or the NCBs. The Governing Council adopts the monetary policy strategy and makes the decisions necessary to ensure the maintenance of price stability. The three elements of monetary policy strategy, adopted on 13 October 1998, are a quantitative definition of price stability and the 'two pillars' used to achieved this objective: the announcement of a quantitative reference value for the growth rate of a broad monetary aggregate (namely, M3: the stock of notes and coins in circulation, the value of bank current accounts, and deposit or interest-bearing accounts), and a broadly based assessment of the forecast for price developments and risks to price stability in the Euro-Zone (ECB 1998 and 1999).[56] The Governing Council may decide by two-thirds of the votes cast to use other operational methods of monetary control as it sees fit but must respect the price stability and open economy requirements of the ESCB. The Governing Council adopts the internal rules of the ECB and exercises its advisory functions vis-à-vis other Community bodies. It has the power to form opinions on its own initiative on the economic policies adopted by the Community and member state governments on matters which fall within its jurisdiction, crucially with regard to the pursuit of 'sound money' economic policies. The Governing Council has also assumed control over the statute provision that allows 'recourse to the national central banks to carry out operations which form part of the tasks of the ESCB' (Article 12, ESCB Statute). The Governing Council performs these functions on the basis of the work undertaken in the ECB's working groups (NCB and ECB experts) and committees (NCB and ECB senior officials) which prepare reports (monthly, quarterly and annually) that are forwarded to the Executive Board and Governing Council for final approval.

The Executive Board implements the Eurosystem's monetary policy – giving necessary instructions to the NCBs – in accordance with the guidelines and decisions established by the Governing Council. This consists of initiating open market operations which play an important role in the Eurosystem's monetary policy for the purpose of steering interest rates, managing the liquidity situation in the market and signalling the system's monetary policy stance. The Executive Board decides the precise instrument to be used (there are five major instruments to conduct open market operations[57]) and the terms and conditions for the implementation of such operations: on the basis of

standard tenders, quick tenders or bilateral procedures. The Executive Board may have certain powers delegated to it by the Governing Council (Article 12 ESCB Statute). The Board prepares the meetings of the Governing Council.

The General Council has assumed responsibility for the tasks previously performed by the European Monetary Institute (EMI) which must still be assumed by a body that includes *all* ESCB NCBs. These tasks include the preparations for setting the irrevocable exchange rates of the currencies joining the Euro-Zone in the future (as in the Greek case in the run-up to its accession in 2001). The General Council also contributes to several ECB functions including: the collection of statistical information; the setting of rules for standardizing the accounting and reporting of operations undertaken by the NCBs; and the establishment of the conditions of employment of ECB staff (some of which come from the three ESCB countries not participating in the Euro-Zone). According to the ESCB's operating procedures, the General Council is also supposed to contribute to the preparation of the ECB's quarterly and annual reports and weekly consolidated financial statements. However, in practice it would be inappropriate for the central bank governors of countries not participating in the Eurosystem (currently Britain, Denmark and Sweden) to make substantive comments on the ECB's reports and statements. The General Council has no role in making Eurosystem monetary policy. It is informed by the ECB President of Governing Council decisions and discusses them. However, the General Council does not have the right to be informed (or consulted) on matters pending before the Governing Council. Moreover – even though the General Council is supposed to continue the work of the EMI – the TEU and the ESCB Statute fail to give it the explicit power to advise the ECB or even nonparticipating EU NCBs on monetary matters.

The debate over prudential supervision

The issue of the role of the ECB in prudential (banking) supervision was discussed briefly in the previous chapter: during the 1991 IGC it was decided to strongly limit the ECB's potential role in this area. The TEU grants the Eurosystem the responsibilities to 'contribute to the smooth conduct of policies pursued by competent authorities relating to the prudential supervision of credit institutions and the stability of the financial system' (Article 105.5), as already encouraged by the First and Second Banking Directives (1977, 1989) and the so-called BCCI Directive which lay the foundations for cooperation (exchange of information), but does not contain specific provisions or institutional

arrangements to this end. The Treaty and Article 25 of the ESCB Statute also grant the ECB the right to offer advice and be consulted on the adoption of EC and national legislation relating to prudential supervision and financial stability and the right to perform specific tasks concerning policies relating to this supervision. Moreover, the TEU establishes a simplified procedure – demonstrating the hope of most member states for progress in this area – that makes it possible, without amending the Treaty, to entrust specific supervisory tasks to the ECB (Article 105.6). However, the precise role of the ECB in this area remains the subject of ongoing debate. It is not unusual that the ECB lacks control over banking supervision, in that the central banks in many advanced industrialised countries do not have this power or share it with ministries of finance (more often there are completely separate institutions responsible for supervision). However, the Euro-Zone is rather unique in that the areas of jurisdiction over monetary policy and over banking supervision – which remains nationally based – do not coincide. ECB Executive Board members argue in favour of improved cooperation between Eurosystem central banks (including the ECB) and national banking supervisors on the grounds that central banks are, because of their responsibilities – including money creation, payment services provision, savings management, etc. – necessarily concerned with the health of the banking system and central bank credit control is managed in 'a situation that is generated by problems of interest to the supervisor' (Padoa Schioppa 1999).[58]

The Basle Committee on Banking Supervision – which was the main forum in which multilateral cooperation among EU banking supervisors could be enhanced – assumed the task of promoting cooperation between the ECB, the NCBs and national supervisory authorities. To give the EU members of this Committee a more specifically Eurosystem profile, their gatherings were officially labelled the Banking Supervision Committee of the ESCB. ECB Executive Board members have sought to develop this cooperation further: to ensure that the system of national supervisors can operate as effectively as a single authority when required, in particular when dealing with local or national banking problems which may have wider effects. In a personal capacity, Executive Board member Padoa Schioppa (1999) argues that it is not necessary to take advantage of the possibility created in the treaties and give the ECB greater powers in this area. Rather he seeks the transformation of the largely voluntary cooperation among banking supervisors into 'a sort of euro area collective supervisor to emerge that can act as effectively as if there were a single supervisor' which will 'assist the Eurosystem in the

performance of its basic tasks'. The simplified legal procedure established in Article 105.6 could be interpreted as a 'last resort clause', which might become necessary if the development of cooperation between the Eurosystem and national supervisory authorities fails to develop. Kenen (1995, 35) argues that if the ECB is not given responsibility for prudential supervision, then it 'must at least have access to the information gathered by [the prudential supervisors] and it must be consulted by them whenever they expect to act in ways that might affect the banking system or the financial system as a whole'.[59]

The ECB has sought to clarify its position on the role of central banks in prudential supervision, most recently in a March 2001 report. The ECB makes the point that the organization of the institutional framework of the Eurosystem weakens the arguments in favour of a separation of banking and supervisory functions, in large part due to the NCBs' loss of control over monetary policy to the ECB. Furthermore, the ECB claims that EMU and the financial integration that it encourages strengthen arguments in favour of a fusion of responsibilities under the control of NCBs. The growth of large banking conglomerates and the increased risk that bank failure could lead to systemic instability increases the need for NCB surveillance: NCBs are part of the wider Eurosystem with greater capacity to assess effectively the potential for systemic crisis. The emphasis placed on the role of NCBs as opposed to the ECB is due in large part to their role managing the Target payment system, which gives the NCBs much greater awareness than the ECB could ever have regarding the situation of the banks.

The handling of solvency crises is neither within the competence of the NCBs nor that of the ECB. Although it is expected that NCBs will be consulted as they have been in the past, the precise role of the ECB remains unsettled and the lack of crisis management capacity of the Eurosystem has been the subject of some criticisism including from the IMF.[60] Most importantly, the worry has existed that the ECB could become an overly generous lender of last resort which would divert it from pursuing price stability. However, ECB Executive Board members and others argue that that these concerns are overstated.[61]

Four levels of co-ordination

I. Within the Eurosystem: the ECB and the NCBs

The ECB's relatively small Executive Board and its weight on the Governing Council (6 out of 18 places, or a third) demonstrates an important feature of the Eurosystem. Compared to other federal

banking systems – including the American Federal Reserve – the Eurosystem is relatively decentralized: national central bankers have more sway collectively than, say, representatives from the American state banks. This reflects the highly decentralized nature of the EU political system and the problematic legitimacy of EU in many member states. Arguably, European citizens are more likely to accept ECB monetary policy if they know that they are represented, however indirectly and unofficially, by NCB governors, and that policy is designed in the fora of working groups, committees and the Governing Council, where NCB experts and officials predominate.

The relative importance of the NCBs in the Eurosystem also reflects practical reality: they are well-established whereas the ECB is a fledgling and small institution. Eurosystem NCBs perform several operations vital to the operation of the Euro-Zone: notably, they conduct foreign exchange operations and ensure the smooth operation of payment systems (including Target). The NCBs hold and manage the official foreign reserves of the Member States (of which they can provide up to 40 billion euro to the ECB) and hold the capital of the ECB (just under 4 billion euro). However, NCBs must follow the regulations, guidelines and instructions of the ECB in these and several other areas: buying and selling securities and other claims; borrowing and lending securities; dealing in precious metals; conducting credit operations with banks and other financial institutions based on adequate collateral; acting as fiscal agents for public entities (although they may not grant them credit facilities or buy their debt instruments directly from them). The ECB can also engage in these activities. The precise role of the ECB in relation to the NCBs depends on the kinds of open market operations selected (with regard to aim, regularity and procedures). NCBs are able to perform tasks beyond those specified in the ESCB Statute, except if the Governing Council decides that these activities interfere with the work of the ESCB. The ECB alone attends Eurogroup meetings and ECOFIN Councils. However, all 12 Eurosystem NCBs (and all 15 ESCB NCBs) occasionally attend informal ECOFIN meetings with varying degrees of participation.

The important role of the NCBs in ECB decision-making (in the working groups, committees and the Governing Council) reflects the reliance of ECB upon the much greater analytical – including statistical – resources available in the NCBs. In this regard, the American Federal Reserve is much better endowed than its Euro-Zone equivalent and relies less on the state reserve banks. The importance of the NCBs in ECB decision-making encourages a combination of collaborative and competitive work (Goodfriend 1999; Mayes 1998 and 2000). In their

attempt to have an impact on Governing Council decision-making, each NCB governor will use the resources of his own NCB to provide the necessary information and strengthen his position in the on-going debate with other NCBs and the ECB Executive Board on appropriate policy and the way that the Euro-Zone economy works.

Despite the often heated debate over appropriate policy, members of the Governing Council are expected to speak with one voice on the basis of the agreed upon forecasts, although there is no legal requirement to do so. The President is spokesperson in the official press conference following the bi-weekly meetings, while the other members of the Council have to explain Eurosystem policy in the member states in their own languages, which arguably creates the possibility of diverging expression and interpretation of ECB policy. However, there has yet to be a publicly expressed substantive difference of opinion between members of the Governing Council (as there has been in several member states between members of national monetary policy committees).[62]

Another potential source of divergence in the public expression of policy is the separate national forecasts published by the independent NCBs. Varying NCB forecasts could send different signals to market operators about the development of ECB policy. However, it is the role of ECB working groups and committees to iron out differences and ensure coherence in all the forecasts of the Euro-Zone prior to their publication. In a move that may spell the beginning of the end of separately published NCB forecasts – or at least their slide in significance – the ECB published its first Eurosystem forecast ('Staff economic projections for the euro area') in its *Monthly Bulletin* in December 2000 (with which the NCB forecasts are expected to be consistent).

A major issue of debate in ECB–NCB relations has concerned the appropriate degree of centralization in the different ways that the ECB uses the NCBs to implement its monetary policy and the harmonization of national practices. Prior to the 1990s, the operational procedures of Eurosystem NCBs differed considerably. However, much of this difference reflected the varying structures of national financial systems and of commercial banks asset holdings. With financial integration and growing convergence, the difference in operational structures has diminished. By the mid-1990s, several EU NCBs, including the four largest, were using similar methods (Kenen 1995: 63–4). Nonetheless, in the third year of Stage Three, variations in methods remain due principally to lingering differences in financial markets

which result, for example, in various forms of collateral. The Eurosystem is the most decentralized banking system in the world. However, national differences do not prevent the operation of a single monetary policy.

II. Within the EU policy-making system

The provisions of the TEU have created a distinct institutional setting for monetary policy-making with the ECB at its core and a unique policy-making style which can be labelled 'supranational'. The Treaty gives some of the other institutions – notably the EU Council of Ministers, the European Council and the European Parliament – specific responsibilities with regard to monetary policy. However, the ECB interrelates informally with a large number of other actors with distinct roles at both the EU and national levels.

The ECB/ESCB does not have complete control over all aspects of European monetary policy. The Council of Ministers (the Council of Economics and Finance ministers, ECOFIN) is given limited powers over monetary policy and the management of the ESCB. These powers are de facto exercised by the Euro-X (renamed the Eurogroup in mid-2000) consisting of the finance ministers of only the member states participating in the Euro-Zone. Lacking a legal personality, the Eurogroup must have ECOFIN confirm all its decisions. The Council can adopt complementary legislation concerning the operation of the ESCB in a limited number of areas, by qualified majority voting on a recommendation from the ECB after consulting the Commission or by unanimity acting on a proposal from the Commission and after consulting the ECB (Art. 42 ESCB statute). In both situations the European Parliament must give its assent. These articles of the ESCB statute concern the following matters:

- the limits and conditions to be imposed on national authorities seeking to consult the ECB on draft laws in the banks field of competence (Art. 4);
- the people subject to reporting requirements to the ECB and the confidentiality regime (Art. 5.4);
- the 'basis for the minimum and maximum reserves to be held by national credit institutions with the ECB, and the maximum permissible ratios between these reserves, as well as the appropriate sanctions in the case of non-compliance' (Art. 19.2);
- the definition of the scope of other operational methods of monetary control if they impose obligations on third parties (Art. 20);

- the limits and conditions on any increase to the ECB's capital (Art. 28.1);
- further calls for foreign reserve assets beyond the limit set in the ESCB statute (Art. 30.4);
- the limits and conditions on the ECB's power to impose fines or periodic penalty payments on undertakings for failure to comply with obligations under its regulations and decisions.

The Council of Ministers is thus empowered to influence future developments of the operation of the ESCB. However, the Council is unable to modify the objectives or tasks of the ESCB or the provisions regarding its independence. The Council of Ministers is also responsible for setting the rate at which new currencies merge into the euro – as with the drachma – while the European Council makes the final decision on entry. Notably, the Council is responsible for the establishment of exchange rate agreements with third countries and has final say over most aspects of external monetary policy. However, when performing these tasks, the Council must consult the ECB, attempt to reach a consensus, and respect the goal of price stability. The organization of co-ordination, focusing upon the role of the ECB, in the area of external monetary policy is discussed in greater detail below.

The ECB also maintains direct relations with the European Parliament (EP), notably in terms of *ex post facto* reporting and questioning. (These relations are discussed in the context of the issue of the ECB's democratic legitimacy in the following chapter.) The EP must be consulted on appointments to the ECB Executive Board. It receives and debates the ECB's annual report and requests that the president and other Executive Board members appear before its committees (notably, the Committee on Economic, Monetary Affairs and Industrial Policy (C4) and the Subcommittee on Monetary Affairs (SC4)) (Art. 113 (ex 109b) EC) (see, for example, ECB 2000b). The TEU and Statute establish no specific appearance requirements. The EP succeeded in obtaining Duisenberg's agreement that he would appear before the Committee C4 four times a year. In its relations with the EP, the ECB pursues several goals. The wide-ranging review of the ECB by the EP's committees can ensure that the Bank's technical decisions are subject to scrutiny from beyond the ESCB. This review can increase awareness and widen support for the Bank's underlying policies and principles. Regular meetings with the EP's committees can also help to personalize the ECB and build public support for its actions. Overall, however, the EP has little say over the ECB's management of monetary policy. As

Dyson (2000: 69) notes, the model of ECB–EP relations 'is no match for the more Lockian-informed practice of US Federal Reserve-Congress relations'. The ECB is not responsible to the EP or other EU institutions: none have the power to dismiss ECB Executive Board members on the grounds of unsatisfactorily performance according to fulfilment of the Bank's own goals (as in New Zealand) (Taylor 2000).[63]

Co-ordination at the European level in the areas of fiscal and macroeconomic policy is leading to greater horizontal fusion and the creation of a form of 'economic government': (as defined in Chapter 3) an institutional set-up at the EU and national levels 'of collective governance among core actors from several institutions and bodies in a multifaceted network which is constituted by mutual participation patterns' (Wessels and Linsenmann 2001; see also Wicks (1999), Wyplosz (1999) and Boyer (1999)). Fiscal, economic and employment policies are all of great concern to the ECB as they have a direct impact on the capacity of the central bank to manage monetary policy to achieve the goal of price stability (the search for an appropriate 'policy-mix') and shape public perception of both the nature of this goal and the ECB itself (Aglietta and de Boissieu 1998). The nature of policy-making differs considerably from the 'supranational' policy-making in monetary matters where the ECB is dominant. The European bank's role in both the 'hard' – binding – co-ordination of fiscal policy (Art. 105 EC and the Stability and Growth Pact) and 'soft' – largely unbinding – co-ordination of macroeconomic and employment policies (Art. 99 and 128 EC) is more subtle and not yet fully fleshed out.[64] Nonetheless, the ECB is an important part of the institutional set-up in these areas of policy-making which directly influence the manner in which it carries out its monetary policy responsibilities. Collectively, these policy processes form part of a 'stabilization state' (Dyson 2000). Unlike the regulatory state, the instruments of stabilization will need to be used in a discretionary and sometimes discreet manner given the likelihood of problematic political implications in many of the Euro-Zone member states.

According to the TEU, the ECB is expected to be involved in a 'constructive dialogue' with the other institutions engaged in this co-ordination – crucially the Council. Opportunities for constructive dialogue are invariably increased by the right of one ECB Executive Board member (normally the President) to attend Council/Eurogroup meetings where matters pertaining to the tasks of the ESCB are discussed. Two members of the ECB Executive Board – along with representatives from national ministries of finance and central banks and the Commission – also attend meetings of the Economics and

Financial Committee, where the negotiations on the details of macroeconomic policy co-ordination take place. The presence of the President of ECOFIN/the Eurogroup and a member of the Commission at ECB Governing Council meetings – and their right to submit motions – also contributes to the constructive dialogue (Art. 113(3) (ex 109b) EC) (Everson 1999).

The precise role of the ECB in these policy areas varies. In the 'hard' co-ordination of fiscal policy, the ECB contributes to policy-making in the Eurogroup aided by the presence of its President (Eijffinger and de Haan 2000). The European Bank consults informally with the Commission alone and formally with national and Commission officials in the Economic and Financial Committee which are given the power (Art. 104 EC) to watch over national budgets. The Stability and Growth Pact (agreed at the December 1996 Dublin European Council) gives the Commission – not the ECB – the power to express opinions to ECOFIN to adopt recommendations, requirements and ultimately impose sanctions if the obligatory annual national fiscal and structural plans are deemed insufficient (Artis and Wrinkler 1997). However, the ECB will also have its word to say on national plans, notably in the Eurogroup and through the Economic and Financial Committee (which must also be consulted) and informally. What the ECB thinks about national plans will invariably have as much influence on Council pronouncements as the Commission's opinion – if not more. The manipulation of interest rates – or the threat of doing so – can be seen as the ECB's most effective sanction of inadequate member state policies. Likewise, the ECB President can appear before the European Parliament to defend the continued imposition of Stability and Growth Pact rules and (one day) even recommend the use of fines, however politically problematic this might be.

The interest rate weapon is likewise a source of influence in the context of the 'soft' (largely unbinding) co-ordination on economic and employment policies. In addition to its links with the Eurogroup (ECOFIN) and the Economic and Financial Committee, the ECB has input in the macroeconomic dialogue (the Cologne process) initiated by the Germans during their 1999 EC Presidency as a means of improving the interaction between monetary, budgetary and fiscal policy and wage developments in order to achieve stronger growth and higher employment – although this dialogue accepts that price stability and appropriate wage developments are crucial to good and sustainable economic performance over the medium and longer term. The Broad Economic Policy Guidelines (BEPGs) – established in the Maastricht

Treaty under article 103 (article 99 of the consolidated treaty) – were clarified to integrate the different 'soft' co-ordination processes at the EU level including the stability and convergence programmes of the Stability and Growth Pact, the National Action Plans for Employment and the Joint Employment Reports. Because of the lack of binding EU rules in this area, however, national central banks will continue to play a vital role in the co-ordination process as the interlocutors with the other elements of the ESCB and national finance ministries (see below).

Despite the gradual development of 'economic government', the lack of binding EU rules in these areas means that co-ordination on macroeconomic and employment policies will remain 'soft' for the foreseeable future despite pressures for continued convergence. In the context of 'soft' macroeconomic policy co-ordination, the links between Eurosystem NCBs and national governments remain vital in terms of establishing the precise policy-mix that is best for each country, in the context of the maintenance of sound money policies, and for the Euro-Zone more generally. However, the ECB will increasingly take centre stage in the co-ordination of NCB efforts.

To date discussions in the Eurosystem have been rather general in nature and, as noted above, the ECB only published its own Euro-Zone-wide forecasts and simulations for the first time in its December 2000 *Monthly Bulletin* (ECB 2000c). The refinement of Euro-Zone-wide analysis should improve co-ordination by helping the Commission and national governments set the guidelines for fiscal, employment and structural policies. It should also improve ECB policy-making transparency which – linked with the accountability of ECB – is a major concern of both economists and political scientists.

Moreover, co-ordination is a two way process: it is meant to shape national government policy-making as well as the formulation of ECB monetary policy (via the NCBs). Much of the co-ordination is informal and indirect (as in most countries where the central bank is independent). The main players never physically sit around the table and agree on what to do. In terms of national policy-making, the focus is currently on actions rather than outcomes. However, the process of policy co-ordination has been improved with the implementation of the Broad Policy Guidelines and the Annual Review of Structural Policies which focus on longer term structural questions such as pensions. Member state governments have to set out their fiscal and structural plans on an annual basis. As noted above, the ECB takes a great deal of interest in the plans and expresses its views to the Council. In the light of the likely developments of national fiscal and structural policies, the

NCB governors and Executive Board members debate appropriate monetary policy. The NCBs will also express the ECB's opinion of the plans at the national level.

Confusing co-ordination on external monetary policy

The respective roles of the ECB and the Council of Ministers in the formulation of external monetary policy were the subject of considerable debate during the 1991 IGC and the contents of Article 109 TEU went through numerous draft versions. The central bankers and several member state governments – notably the German government – were concerned with the inflationary effects of exchange rate agreements which might require ECB intervention on the foreign exchange markets in a manner damaging to the pursuit of price stability (precisely the Bundesbank's fear with regard to its obligations in the context of the EMS). Because of this concern several pro-EMU economists, including Gros and Thygesen (1992), opposed the creation of a residual EMS. Other member state governments insisted that governments, through the Council of Ministers, keep their control over exchange rate policy. The careful, rather complex, wording on this matter in Article 109 TEU should be quoted at length.

> 1. … the Council may, acting unanimously on a recommendation from the ECB or from the Commission, and after consulting the ECB in an endeavour to reach a consensus consistent with the objective of price stability, after consulting the European Parliament, in accordance with the procedure in paragraph 3 [below] …, conclude formal agreements on an exchange rate system for the ECU in relation to non-Community currencies. The Council may, acting by a qualified majority … and after consulting the ECB in an endeavour to reach a consensus consistent with the objective of price stability, adopt, adjust or abandon the central rates of the ECU within the exchange rate system.
> 2. In the absence of an exchange rate system in relation to one or more non-Community currencies as referred to in paragraph 1 [above], the Council may, acting by a qualified majority either on a recommendation from the Commission and after consulting the ECB, or on a recommendation from the ECB, formulate general orientations for exchange rate policy in relation to these currencies. These general orientations shall be without prejudice to the primary objective of the ESCB to maintain price stability.

> 3. … where agreements concerning monetary or foreign exchange regime matters need to be negotiated by the Community …, the Council … shall decide the arrangements for the negotiation and for the conclusion of such agreements. These arrangements shall ensure that the Community expresses a single position. The Commission shall be fully associated in the negotiation. … Agreements concluded in accordance with the paragraph shall be binding on the institutions of the Community, on the ECB and on Member-States.
> 4. Subject to paragraph 1 [above], the Council shall, on a proposal from the Commission and after consulting the ECB, acting by a qualified majority decide on the position of the Community at the international level as regards issues of particular importance to economic and monetary union and, acting unanimously, decide its representation … .

The interpretation of Article 109 remains a matter of debate.[65] Paragraph 1 is relatively clear, although there is no indication as to what the attempt to reach consensus would really amount to. Paragraph 2 fails to note which body has the power to judge whether exchange rate agreements are inflationary – or how it would do so. The answer cannot be found in the third paragraph's stipulation on the Council's decision-making power which is cited in the first but not the second paragraph. The lack of clarity raised concerns regarding the ECB's ability to maintain price stability, heightened since the exchange rate crises of 1992–93 and the obligation placed on the Bundesbank to provide massive assistance to support weaker currencies in the ERM.

However, the threat to price stability is not particularly great for reasons that are both institutional and practical. On the institutional side, the Council can only enter into a formal agreement on a proposal from the Commission or the ECB, preventing unilateral action. Moreover, any 'general orientation' guidelines for exchange rate policy that the Council establishes on its own or with country partners (such as those found in the Plaza and Louvre Accords of 1985 and 1987) would not be binding on the ECB. Although not clearly established in Article 109, it has also widely been accepted that the ECB could be the only judge to determine the compatibility of these guidelines with the goal of price stability (Kenen 1995).

On the practical side, Euro-Zone member states are far less interested in exchange rate agreements with major currencies such as the US dollar and the yen than previously because of the much diminished exposure of the Euro-Zone economy to foreign currency fluctuations

than that faced by individual EMS countries prior to the start of Stage Three. Moreover, most members of the ECB Governing Council, emphasizing the ECB's primary goal of price stability, appear to share the Bundesbank's scepticism towards exchange rate agreements and even currency stabilization on the grounds that this could distract domestic monetary policy from the primary purpose of securing internal price stability.[66] The ECB thus ignored the demands of German Social Democrat government leaders (both Lafontaine and Schroeder) for more active policies in this area.

Some observers claimed that for much of 1999 and 2000 there were strong tensions within the ECB Governing Council between supporters of a flexible currency regime and supporters of a more managed exchange rate policy (Padoan and Henning 2000: 41). The dramatic decline of the euro versus the dollar since January 1999 – and the considerable attention paid to this by the European media – finally prompted coordinated interventions with the US Federal Reserve and the Japanese central bank in September and November 2000. (See Chapter 6 for detailed coverage on the interventions.) Officially, these interventions were justified on the grounds of the impact of the dollar's rise and 'economically unjustified' slide of the euro on the world economy and the potential contribution to Euro-Zone inflation. They were designed to break the widespread expectations in the markets that the ECB would not intervene and to discourage the reigning pessimism in the markets on the value of the euro. Support for occasional interventions, however, does not mean that the Governing Council has embraced an actively managed exchange rate policy let alone growing support for exchange rate target zones. ECB President Duisenberg (2000c) has repeatedly reaffirmed the ECB's opposition to the establishment of any exchange rate target and the dangers of ex ante exchange rate co-ordination to the ECB's mandate and independence. The overall policy mix in the Euro-Zone of tight fiscal policy required by the Maastricht convergence criteria and the Stability Pact, combined with a flexible monetary policy (the so-called Clinton–Greenspan combination) appears sustainable in the medium term.

A further reason for the limited preoccupation with the potential impact of external monetary policy on the Euro-Zone has been the small number of ERM II members. Interventions in the context of ERM II – consisting initially of Denmark and Greece alone and now just Denmark – cannot seriously threaten the pursuit of price stability in the Euro-Zone. However, the extension of the ERM II to central and

eastern European accession countries will create more concern for the ECB.

It is perhaps surprising that the complicated machinery of the Euro-Zone's external monetary policy-making has not yet been clarified and the elements addressed in the TEU not yet fully operationalized. ECOFIN (Eurogroup) possesses the leading role in the formulation of external monetary policy, except for foreign exchange operations for which the ECB is responsible. However, there is a lack of clarity on several matters: the line between policy formulation and operations, the organization of internal consultation between the ECOFIN and the ECB on intervention and the role of the Commission. Padoan and Henning (2000) argue that it would be highly problematic if the ECB had to assume authority over external monetary policy in the event that the Eurogroup was incapable of taking action. They doubt that a central bank alone could sufficiently manage a number of international contingencies. They point out (2000: 36) that:

> Financial relations with countries such as Russia, international financial rescues, and even foreign exchange intervention have a heavy political content and are generally negotiated by political authorities. A central bank whose transparency and democratic accountability were under scrutiny, such as the ECB, would be well advised to secure political cover for external monetary operations (36).

III. Cooperation and co-ordination with other EU NCBs

A third level of cooperation/co-ordination concerns the relations between the ECB and those ESCB central banks not participating in the Eurosystem – the United Kingdom, Sweden and Denmark (since June 1998), Greece (from June 1998 to the end of 2000) and future new EU member states. The TEU imposes no reciprocal responsibilities on the ECB with regard to the management of the exchange rates between the euro and non-participating currencies. Article 109k requires EU member states not participating in EMU to assume only a vague exchange rate obligation (to treat their exchange rates as matters of common interest). The ECB's General Council is the only forum for the meeting of all the ESCB central bank governors. However, the TEU and the ESCB Statute fail to note that the General Council inherits the responsibilities of the EMI for fostering monetary and exchange rate policy co-ordination and monitoring the EMS. Indeed, given its lack of

powers and right to information (discussed above), the General Council is an inadequate body to bring about this fostering.

Kenen (1995) argues that the organization of an adequate forum for promoting exchange rate co-ordination between the ECB/Eurosystem and the non-participants is important. Although the number and economic importance of the member states not participating in EMU is lower and less than Kenen had feared, the future accession of central and eastern European countries will likely increase the significance of this level of co-ordination. Kenen (1995; 190) recommends that

> the treaty should be amended to establish a new body comprising the president of the ECB and the governors of the central banks of the nonparticipating countries. It should not replace the General Council, which will have duties of its own, but should have responsibilities and powers similar to those of the EMI. It should have the right to be consulted in advance concerning important policy decisions by the Governing Council of the ECB and the right to give advice to individual central banks, including the ECB. Furthermore, it should be made responsible for managing exchange rate arrangements linking the ECU with the nonparticipants' national currencies.[67]

Kenen also anticipated the creation of a residual EMS with mutual obligations for the ECB and the participating countries. All four member state governments not participating in EMU signed up to the ERM II agreement in September 1998. However, they were not required bring their currencies into the mechanism. Greece and Denmark did so, which potentially mitigated the co-ordination problem. However, the ERM II has kept the ±15 per cent fluctuation margins of the post-1993 ERM and it minimal reciprocal agreements. Moreover, the United Kingdom and Sweden have opted for floating. As members of the ERM II they would have been obliged to continue respecting the conditions of the original EMS: a regular exchange of information with the ECB on developments in foreign exchange markets and prior agreement of other EU central banks to use currency issued by them for interventions or other transactions in excess of certain amounts. The more general aim of the ERM II agreement is to encourage all participants to orient their economic policies towards encouraging stability and convergence. However, this does not encourage cooperation, let alone co-ordination, in exchange rate management. In the obviously

asymmetric ERMII, the burden of adjustment falls on the participating countries outside the Euro-Zone.

IV. The ECB, the external representation of the Euro-Zone and international level cooperation

What role should the ECB play in the external representation of the Euro-Zone in intergovernmental organizations and international level cooperation that touches upon its areas of competence? This issue links into the broader problem of the division of responsibilities among EU institutions over the major elements of economic policy and the respective roles of ECOFIN, the Commission and the ECB in external representation.[68] The current absence of a Euro-Zone equivalent of the US Treasury Secretary (despite efforts by the French and Belgian Eurogroup presidencies to create a 'Mr Euro') potentially strengthens the role of the ECB (however desirable). The issue of representation has been a subject of debate since the Delors Committee. However, serious discussion on the matter only began following the creation of the ECB in June 1998, awaiting a decision by both international organizations and ECOFIN (as stipulated in Article 109.4 TEU).

The official ECB position on external representation runs as follows (Duisenberg 2000). The ECB plays three different roles in the international community which are determined by the Eurosystem's tasks involved in international relations. First, the ECB is a major and autonomous counterpart of the Eurogroup whenever the Eurosystem's exclusive jurisdictions – monetary policy and related central banking tasks – are involved in international relations. Second, with regard to issues relating to the exchange rate of the euro, the ECB shares with the Eurogroup the responsibility for consultation with third parties. However, the ECB is solely responsible for external representation concerning foreign exchange operations. Third, within the limits of the Eurosystem's field of competence, the ECB can advise other Euro-Zone policy-makers on international issues. In specific circumstances the ECB may also act as 'catalyst for cooperation' with third countries. This may happen when the Eurosystem develops common views on issues which fall within the competence of other Euro-Zone authorities (mainly national governments), but in which the Eurosystem has a strong institutional interest, in accordance with its statute. This applies, for example, to issues related to the stability of global financial markets and the architecture of the international monetary system, which in turn affects the ability of the ECB to pursue its price stability goal in the Euro-Zone.

The ECB made its initial demands for right to external representation on the basis of Article 6 of the Statute of the ESCB. Article 6.1 provides that 'in the field of international co-operation involving the tasks entrusted to the ESCB, the ECB [namely, the Governing Council] shall decide how the ESCB shall be represented' by the ECB and/or by Euro-Zone NCBs.[69] Moreover, ECB officials have pointed to Article 109 TEU, paragraph 3 which stipulates that the coordination on external monetary policy must 'ensure that the Community expresses a single position'. ECB officials claim that in order to ensure consistency and coherence in the development of Euro-Zone positions, the ECB must be present whenever matters falling into its jurisdiction are discussed (Padoa-Schioppa 1999). ECOFIN/Eurogroup also has an interest in ECB participation in international fora. The potential success of (eventual) international exchange rate cooperation (under the aegis of the G-7) or concerted intervention (organized through the IMF) will rely very much on both ex ante and ex post internal Euro-Zone co-ordination that ensures that the ECB will be willing and able to implement the policy bargain (Kenen 1995; 118). Dobson (1991) argues that the difference between success and failure in the work of the G-7 depended crucially on the degree of agreement between the German government and the Bundesbank (see also Kennedy 1991, Henning 1994). The ECB will likely play a similar role in the context of international exchange rate management.

On 1 December 1998, ECOFIN proposed arrangements endorsed by the Vienna European Council a few days later. These dealt with ECB representation in bilateral and multilateral intergovernmental fora, including the International Monetary Fund (IMF), the Organization for Economic Cooperation and Development (OECD) and the Group of Seven (G-7) Finance (meetings of finance ministers and central bank governors from the G-7 countries, distinct from the summit meetings of heads of state or government, and responsible for exchange rate policy cooperation). ECOFIN wanted three-member Community delegations to attend these international fora, including the ECB president and a Commission representative. The arrangements were described as pragmatic and temporary to be developed further. ECB representatives were also to be actively engaged in the preparation of Euro-Zone positions for these meetings within the Economic and Financial Committee (EFC) prior to being finalized in the Eurogroup. Given the diverse circumstances of bilateral economic relations with third countries, the EU finance ministers did not set arrangements for Euro-Zone representation. The presence of the ECB in these bilateral discussions would be left to the Council Presidency.

The organization of ECB representation in international fora required difficult negotiations with international partners. Difficulty arose in part from the fact that intergovernmental institutions such as the IMF or the OECD are – with minor exceptions such as Belgium and Luxembourg – organized on the basis of a strict correspondence between one currency and one country. The situation was potentially less problematic with regard to the G-7 Finance and the G-10 Governors which, set up under the aegis of the BIS, are informal, less institutionalized fora. Special arrangements therefore had to be designed in order to enable the ECB to contribute to the representation of the Eurosystem in these institutions. With regard to the IMF, this was less problematic given that there was no question that the ECB could gain membership and voting powers. The major concern was the over-representation of the Euro-Zone; thus Commission representatives were not allowed to attend IMF Executive Board meetings. In December 1998, the IMF Executive Board agreed to grant observer status to the ECB (IMF 1998) and the right to send a representative to Executive Board meetings (which did not require an amendment to the Fund's Article of Agreement).[70] The ECB representative attends and has the right to speak at meetings on the role of the euro in the international monetary system, multilateral surveillance of the Euro-Zone and individual countries within the zone, international capital market reports and world economic and market developments. The ECB observer represents the ECB at IMF Executive Board meetings on agenda items recognized by the ECB and the IMF to be of mutual interest for the performance of their respective mandates. The representative can also be invited to other Executive Board meetings – such as discussion on international financial architecture – although s/he does not have the *right* to attend. The official Euro-Zone representative on the IMF Executive Board remains the Council President (chair of the Eurogroup). The ECB's role is limited compared to that of the member state governments, although its presence may help to unify the views of the EU participants on particular matters.[71]

Likewise with the OECD, another intergovernmental institution, ECB membership was out of the question. However, the organization deals with issues – notably its surveillance of the Euro-Zone – relating to the tasks assigned to the Eurosystem. In February 1999, the OECD Secretary General confirmed that the ECB would be allowed to participate in the work of the relevant committees and working groups as a separate member of the EC delegation alongside the European Commission.[72] The ECB also obtained observer status in the meetings

of the G-10 Ministers and Governors which are organized in connection with the IMF Interim Committee meetings. It should be stressed that observer status in these fora does not mean a passive role for the ECB: the ECB is the most independent central bank in the world and responsible for the monetary policy of an area with the second largest economy. ECB Executive Board members (and Eurosystem governors) have taken strong outspoken positions on major international monetary, financial and other economic issues.[73]

Despite its informal status, ECB representation in the G-7 (G-8 including Russia) proved more problematic. The EU's proposals were rejected by the non-European members of the G-7 on the grounds that the Euro-Zone would be over-represented in the organization, given the presence of Euro-Zone NCBs. Nonetheless, on an ad hoc basis the President of the ECB started participating in G-7 Finance meetings from October 1998 on issues related to monetary policy and multilateral surveillance, including exchange rate policy cooperation. Provisional arrangements for Euro-Zone representation were finally agreed upon at the June 1999 G-7 meeting in Frankfurt. The ECB president would replace Euro-Zone NCB governors during the first part of G-7 Finance meetings when monetary matters are discussed. The viability of these arrangements remains to be seen. The aim of many G-7 participants and Euro-Zone member states is to form a 'monetary G-3' (following the eventual accession of the UK to the Euro-Zone) which might eventually be paralleled by a finance trio. The eight smaller Euro-Zone member states currently excluded from the G-7 have a particular interest in strengthening the role of the ECB. In central banking fora, the participation of the ECB has been more straightforward: the ECB president participates in the meetings of the G-10 Governors organized in the context of the BIS and in the committees under the aegis of the governors, notably the Basle Committee on Banking Supervision and the Committee on the Global Finance System.

The ECB does not find the temporary ad hoc approach to its representation in international fora satisfactory. Duisenberg (2000b) argues for the gradual but fundamental adaptation of the traditional institutional framework of international relations on the grounds that the existing framework – based on the representation of national governments – 'was not tailored to the involvement of monetary unions, nor to the advent of the Eurosystem, and more generally the [Euro-Zone], as a new actor in international relations'. In other words, the observer status of the ECB in the IMF and OECD is acceptable, but only as a first step to improved representation. With regard to

Eurosystem representation in international fora where both ministers and bank governors are represented (G-7 Finance, G-20), Duisenberg focuses on the capability to speak with one voice (if and when appropriate). He argues that the specific arrangements already established 'may still call for some improvement'. In these fora, Duisenberg seeks a clearer Euro-Zone political counterpart for the ECB: instead of the four or twelve Euro-Zone member state finance ministers (in the G-7 and G-20 respectively), he would prefer a single Eurogroup representative with a higher profile. This would make it easier to achieve and maintain single policy positions in the context of multilateral discussions and negotiations, and thus simplify international level decision making as well as the ECB's role. The aim here is to overcome a more general problem with the internal coordination of external monetary policy: namely, the lack of rules to oblige member states to adhere to a common policy and speak with one voice.

At the bilateral level – notably in terms of intervention in foreign exchange markets and the organization of financial rescues – the respective roles of the Council President and ECB have yet to be determined. The ECB has proceeded in forging improved bilateral relations with other central banks. Notably, it has become involved in the EU enlargement process by providing assistance to the central banks of central and eastern European candidate countries to prepare them for participation in the ESCB following accession and their eventual participation in the Eurosystem. In Helsinki in November 1999 and Vienna in December 2000, the representatives of the ECB Executive Board, the then 11 Eurosystem NCBs and the central banks of the 12 countries applying for EU membership met together in seminars to review the central banking issues involved in the accession process, identify the main problem areas and enhance cooperation between the Eurosystem and applicant NCBs. Issues of common interest include primarily monetary and foreign exchange policy matters, financial market structures and the legal convergence of central bank statutes in applicant countries. Tommaso Padoa Schioppa, the Executive Board Member responsible for international and European relations has also visited other central banks – starting with Japan, Korea and China in early 1999 – and other central bankers have been received in Frankfurt, with the aim of improving bilateral ties on issues of mutual concern including operational facilities, cooperation in matters concerning prudential supervision and financial stability, the provision of technical assistance but also systemic issues, such as the strengthening of the international monetary and financial system. In addition to central

banks, the ECB has begun to establish contacts with other relevant foreign institutions, such as banking supervisory authorities, local banking associations, stock exchanges and national public administrations. ECB Executive Board members have, in numerous private banking fora called upon improved cooperation between the ECB and the private sector with the aim of strengthening the international financial architecture (for example, Duisenberg 2000).

Duisenberg (2000b) explains the rationale behind the ECB cooperation activities at the international level. Much of this cooperation is consultation, which consists of a regular mutual exchange of information and views in both international fora and bilateral contacts. The principal aim here is to better incorporate possible spill-over effects from third country policy actions into the ECB's analysis of price developments in the Euro-Zone. In the IMF and OECD, cooperation also involves Euro-Zone surveillance: the regular monitoring and assessment of the economic policies of the Euro-Zone and its member states. International surveillance contributes to the transparency of both the ECB and Euro-Zone governments as both the IMF and the OECD make their assessments of Euro-Zone economic policies available to the public. Cooperation can then extend to the development of 'standards' and 'codes' developed by the international community which constitute a form of multilateral rule-making to be implemented on a voluntary basis, for example, 'The IMF Code of Good Practices on Transparency in Monetary and Financial Policies'. The ECB participates in international organizations also to watch closely over the development of cooperation – consultation, surveillance and co-ordination – among macroeconomic policy-making officials. Above all, ex ante co-ordination[74] of macroeconomic policies and exchange rates creates the greatest potential danger for the ECB's mandate and independence.

Conclusion

This chapter has provided a brief overview of the organisation, powers and functions of the ECB. We have also explored some of the main issues of concern or debate regarding the operation of the ECB and its relationship with other institutions at the four different levels of co-ordination: Eurosystem NCBs in the management of monetary policy; other EU institutions (notably the Eurogroup) in the co-ordination of EU macroeconomic and Euro-Zone external monetary policy; ESCB and specifically ERMII NCBs; and Euro-Zone governments, NCBs and the European Commission within international

institutions and gatherings (IMF, OECD, G-7 and G-20). The role of the ECB and Eurosystem in the monetary and economic management and representation suffers from a lack of clarity in some areas (notably in external monetary policy) or, in the ECB's view, insufficiency in others (notably prudential supervision and representation in international relations), and is still being fleshed out. The question of the ECB's role in the four levels of co-ordination is complicated in that it frequently involves wider issues, crucially the bank's problematic legitimacy. The precise role of the ECB in the four levels of co-ordination will remain the subject of debate for some years to come.

5
The Independence of the ECB

> It's normal for the political side to give suggestions or opinions, but it would be abnormal if these suggestions were listened to.
>
> Wim Duisenberg, President, European Central Bank[75]

Introduction: the institutional dilemmas of an independent central bank

The monetary policy of the European Central Bank (ECB) was in many ways supposed to be different than the policies pursued by national central banks. As the *Financial Times* noted, 'It was not meant to be like this'.[76] From the ECB's first days in office in June 1998, the ECB's policies were extremely politicized, its independence questioned, and its credibility doubted. What is immediately and abundantly clear is that the institutional and policy dilemmas faced by the ECB are quite similar to the dilemmas faced by other national central banks over the last 50 years. Exchange rate fluctuations, to say nothing of internal political pressure from the Euro-Zone governments, act as a direct constraint on the ability of the ECB to pursue an independent monetary policy. The ongoing efforts of the ECB to prop up the sagging euro – which has lost over 20 per cent of its value since its inception in January 1999 – illustrate the dilemmas the bank faces. While the weak euro boosts exports from and employment within the Euro-Zone, the euro's value demonstrates in part the power of the markets over the ECB, contributes to the credibility problems of bank, complicates trade relationships with non-euro members and the US, and undermines public support and confidence in the euro. The first years have been difficult ones for the ECB.

With the ability of nations to restrain capital all but eliminated as a viable policy option, the choices facing the ECB are clear. The ECB can retain 'domestic' (meaning within the Euro-Zone) monetary autonomy and pursue targeted monetary objectives, but sacrifice a measure of exchange rate stability in the process. Or the ECB can pursue a monetary policy emphasizing exchange rate stability but at the expense of 'domestic' monetary policy autonomy. Although the choices for central bankers and politicians may not always be so simply arranged on an autonomy–exchange rate stability continuum (Cohen 1993), for analytical purposes such an approach can be useful to understanding the degree of ECB independence. This chapter examines the level of political, personal and financial independence of the ECB. Drawing upon previous analyses of other independent central banks, in particular the Bundesbank, we can set forth some basic propositions on the likelihood of an independent ECB monetary policy. Indeed, most studies have suggested that the ECB is in fact more independent than the Bundesbank (DeHaan 1997; Elgie 1998). Our analysis confirms this impression and suggests that we should expect the ECB to be quite independent in terms of its strict mandate on interest rates and price stability.

At the same time, the ECB will experience increased and ongoing difficulties as a result of external exchange rate politics that will complicate its Euro-Zone monetary objectives. Adding to these difficulties is the lingering debate over the democratic accountability of the ECB. Can an independent ECB be held accountable for its actions? Indeed this question is central to our analysis of the possible new 'leviathan' emerging on the European landscape. This chapter seeks to clarify some of the debates over the accountability and independence of the ECB and provide our conception of the relationship between these two concepts.

Debating central bank independence

In the negotiations leading to Maastricht, the key debate over the institutional structure and the policy-making powers of the future ECB was over the issue of the degree of central bank independence from political influence (Hasse 1990; De Haan 1997; Brentford 1998; Verdun 1998a; and Loedel 1999a). More directly, would nation states have any authority and influence in the policy decisions of the future ECB? While most analysts focused on the influence of states, other possible influences – business and banking associations, and labor unions, for

example – would also need to be limited. The focus on central bank independence was strongly articulated by Germany and especially Bundesbank officials, given Germany's strong tradition of non-inflationary monetary policy and independent central bank (Loedel 1999b). Germany's views were also shared by a number of the leading architects of EMU, primarily within the Delors Committee (Verdun 1999).

The view from Germany and the Delors Committee was based on a series of arguments. Most empirical studies have shown that countries with independent central banks achieve substantially lower rates of inflation than countries in which the central bank is controlled directly by the government (Alesina and Summers 1992; Bernard 1998; Blinder 1998), although there is mixed evidence from some other countries – primarily in the developing world (Posen 1993). Others argue that independence is important due to technical factors – policy-making from an independent central bank can be more straightforward and responsive to short-term needs of the economy in order to avoid the inevitable delays or 'decision lags' that exist in the normal political process. While some can argue that central banks also suffer such 'time-lags' (for example, 6–9 months or even much longer) and their decisions have not always been accurate or timely in nature, proponents counter that an independent central bank will at a minimum remain consistent in its monetary policy orientation.

One can also see constitutional principles at work and envision an independent central bank as a separate branch of government that can check potentially damaging policies of other government branches (Issing 1999). For example, the German Bundesbank has long suggested that that the bank acted as a state within state, a coalition partner of the government. In other words, the Bundesbank could act as a check upon the actions of the federal government if the government's spending policies threatened price stability. The same logic could be applied to the ECB as it constantly reminds the Euro-Zone governments to reign in spending under the limits set forth in the Stability and Growth Pact. Furthermore, in view of the politicians' short term motivation and propensity to spend in support of lobbies, interest groups and other pressures, issuing money, that is, making the central bank provide credits when needed, should be limited or capped to some ceiling. Tight money can only be insured if the central bank acts as an independent economic and political counterweight to the spending proclivities of the government. In short, the lessons of history have provided substantial evidence that a nation's currency

should be protected by an independent central bank due to the government's inability to properly manage a nation's monetary stock.

Central bank independence and its corresponding impact on policy credibility have also been cited by many analysts as an important reason for freeing the hand of a central bank. Independence has a strong impact on policy credibility and vice versa (Blackburn and Christensen 1989; Woolley 1992; Schaling 1995; Nolan and Schaling 1996; Mayes 1998). A central bank with a strong reputation for credible anti-inflationary policies may be able to resist political pressures to reform the legal structures and statutes of the bank that might threaten price stability. More importantly, perhaps, the issue of credibility centres on whether and how policy-makers can make credible commitments about their future conduct. Independence and the credibility that flows from it need to be understood in terms of actual behaviour and not just institutions. The structure of the economy and internal politics may present policy-makers with difficult tradeoffs between short-run policy benefits and long-run policy costs that may impact credibility. An institution such as a central bank can be considered credible if it is willing to let the government, the public and the economy incur the costs of their decisions.

For example, during the speculative crises within the EMS in 1992–93, many observers puzzled over the fact that the French franc came under more pressure than the DM, despite the franc's underlying strength in terms of the economic fundamentals (primarily inflation) of the French economy. The answer to this puzzle is rather simple. It centres on monetary credibility: the markets trusted the Bundesbank to bring the inflationary pressures in Germany under control; the markets did not believe the French government's ability – in the face of elections and growing unemployment – to withstand the pressure to reflate. The question today: Has the ECB established the same level of credibility as the Bundesbank? While this chapter touches on this subject in so far as it relates to independence, Chapter 6 tracks in more detail the credibility crisis of the European Central Bank.

Credibility of monetary policy will also depend not just upon monetary policy alone but rather upon the perceived coherence of the overall macroeconomic programme. This coherence, together with the intellectual and political consensus on the monetary theory being used and the objectives and conduct of monetary policy, subject to the conditions of the current political climate, significantly influences credibility (see, for example, Schaling 1995). Not surprisingly, the independent structure of institutions makes any promises about future behaviour

more believable. The Bundesbank used this understanding of credibility in its decision to publish yearly quantitative targets of the money stock. Focusing on a medium term monetary target like M3, the Bundesbank believed it could make credible commitments to ensuring a pre-determined range of monetary growth. If the bank failed to meet such targets, which it did on occasion, the credibility of the bank can be harmed.[77] Despite some problems with the M3 indicator, the markets ultimately trusted the Bundesbank to control monetary growth.

As for the ECB, it employs the M3 indicator, after the insistence of the Germans, but also targets other macroeconomic indicators like inflation (following the lead of the British). The OECD has argued that the ECB's intermediate monetary target of M3, which was set at a reference value (or loose target) of 4.5 per cent (measured on an annual basis) for 1999, 2000 and 2001, may not be useful for setting policy.[78] This broad monetary measure most likely will be subject to great instability as the single currency markets develop. Moreover, the ECB must deal with vastly divergent economic indicators in growth and unemployment, for example, rates of higher growth and lower unemployment in Ireland as compared with lower growth and higher unemployment in Germany. Early decisions by the ECB to emphasize one target over another when setting interest rates has in part weakened the perception that the ECB has full mastery over the numbers. Whatever the disagreements over M3 or other measures, the freedom to decide which measures are employed and the freedom to stick to these measures despite political protest from governments, should be seen as important pillars of an independent central bank establishing credibility.

Democratic accountability

While these arguments carry with them considerable merit, they should not go unquestioned. Perhaps the strongest argument against central bank independence is based on legal or democratic theory (Arntenbrink 1999; Berman and McNamara 1999; Buiter 1999; Magnette 2000; Majone 1996, 1999; and Verdun 1998a). The theory would contend that an independent central bank cannot be held democratically accountable for its politically sensitive actions. In other words, the delegation of power to non-elected officials (the ECB Governing Council) can only be acceptable in a democratic society if the bank is accountable in some manner to democratically elected

institutions. One might ask who should be held responsible for the effects on employment created by the ECB's monetary policy – the bank or the governments of the Euro-Zone? Central banks remain free from the task of legitimating their power (via elections), unlike other representative institutions. This is of central concern to the ECB and the institutions of the European Union as they grapple with questions of democratic deficits, pressures of regionalism, and issues of transparency. General consensus exists that the EU – and thereby the ECB – should be transparent and largely accountable to its citizens in the future.

ECB President Duisenberg's assertions – that the ECB's definition of price stability as an annual increase in the Harmonized Index of Consumer Prices (HICP) for the euro area of below 2 per cent acts as a yardstick against which the public can hold the ECB accountable[79] – suggest a differing (economist) view on accountability. This view sees accountability and independence as mutually dependent. But Duisenberg's confidence in the ECB's monetary indicators and objectives do not necessarily assuage sceptics who see the ECB as beyond the control and legitimacy of democratic processes and institutions. While we recognize that accountability and independence can be served by quantifying monetary objectives (see also Arntenbrink 1999) and are interrelated, we do not fully accept the notion that merely publishing monetary objectives meets the full standards of democratic accountability.

Specifically, as Verdun notes, 'the lack of formal parliamentary control over the (ECB's) decision-making process … has led to considerable concerns about democratic accountability: the aspect of secrecy, technocracy and lack of transparency …' within the European Union (Verdun 1998: 111). More bluntly, Buiter warns that the 'lack of openness, transparency and accountability …' threaten to 'undermine the viability of the whole enterprise' (1999: 185). In principle, one can argue that the final decisions and the priorities, which are given to monetary policy, must lie with the European Parliament or some other nominally representative body – perhaps the Council of Finance Ministers. It follows that if necessary, monetary policy should be subordinated to fiscal policy or other objectives laid out by popularly elected officials. Only democratically elected officials of the government have the respective legitimacy and authority to proceed with the negotiations and reach an agreed upon solution. As powerfully stated by Berman and McNamara, allowing the ECB 'to rest unchallenged both damages democracy and begs important questions about who the

winners and losers of economic policy should be' (Berman and McNamara 1999: 2). In this vein, noted economist Peter Kenen has suggested that the European Parliament be given greater authority over the European monetary policy-making process (Kenen 1995). Again, more bluntly, Buiter suggests evolving a 'European Parliament with teeth' (1999: 207).

Clearly, the issue of transparency and accountability is framed politically in the context of a concern for the lack of democratic control over monetary policy-making and democratic legitimacy of the EMU project more broadly (see Elgie 1998 and Elgie 2001; Taylor 2000; Verdun and Christiansen 2000). In a democratic society, transparency and accountability are essential if central bank independence is to remain politically acceptable. Political scientists are concerned about the exceptional strength of the ECB's policy mandate and independence, the absence of counterbalancing EU institutions and the weakness of democratic accountability.[80] Verdun and Christiansen (2000) discuss the problematic nature of the establishment of a powerful ECB prior to the emergence of a political community, and notably the institutions of representative democracy, in which the bank's decisions, or, more significantly, the procedures for the taking of such decisions can be grounded (163). The ECB lacks the societal embeddedness that legitimizes the policy-making of other non-majoritarian institutions such as independent national central banks and supreme courts. Verdun and Christiansen (2000) write:

> The output orientation of much of the debate about the benefits and the costs of EMU signifies that policy-makers regard its economic and social effects as the strongest, perhaps even as the only, possible legitimating aspect of the single currency. Such a perception makes it hostage to the economic fortunes of the day… (176–7).

The legitimacy problem has placed increased focus on the matters of accountability and transparency. Monetary policy decisions will affect member states differently due to different national economic cycles (despite some convergence) and differently structured economies. Given the lack of financial transfer payments to compensate those parts of the Euro-Zone suffering from asymmetrical shocks, limited labour mobility and the strong constraints placed on the use of national fiscal instruments, the ECB's response to these shocks will be of considerable importance.

The risk remains strong that some member states may come to feel disadvantaged by ECB monetary policy, that the legitimacy of the bank will be called into question and the pressure will increase on governments to speak out. Doubts about the ECB's legitimacy increase the need for Executive Board members to give frequent interviews, press conferences and speeches about goals and instruments. National central bank governors need to do the same at the national level. Likewise, the decision to hold two Governing Council meetings a year in other member states was designed to improve the visibility of the ECB. Many call for strengthened links between the ECB and the EP as another move to improve the legitimacy of the ECB. However, this is inherently problematic given that the EP, despite being directly elected, is neither well understood nor well liked by many Europeans (Dinan 2000, 478). Other observers, led by the French government, argue that the legitimacy problem can be partially resolved by creating a stronger and more visible political counterweight to the independent ECB: the European equivalent of the American Treasury Secretary.

Despite the view of political scientists, the precise nature of ECB transparency and accountability is still a matter of some debate. Many economists and market analysts define transparency and accountability in terms of monetary strategy, communicative effectiveness, and co-ordination with other policy-makers. In particular, they focus on the two-pillar strategy of the ECB, the bank's ability to communicate its strategy to the public and the markets, and the ability of the bank to co-ordinate the strategy with leading policy-makers – whether at the national level or through EU institutions (the Eurogroup, for example). Central banks need to make the public aware of the benefits of price stability as memories of high inflation are fading. Clear monetary goals can also help to guide inflationary expectations and thus influence the behaviour of firms and workers. But perhaps most important of all, central banks need to communicate clearly with the financial markets. By becoming more predictable, central banks can help to make market reactions to interest rate changes easier to predict, which then makes monetary policy more effective. In this regard, and with the ECB's own admission – confirmed in a number of interviews – the ECB has not always performed effectively.[81] 'We need to sell it better,' confided one EC banker. Another EC banker indicated that transparency demanded that the ECB avoid mistakes and, if mistakes were made, to be 'honest' with the public about these mistakes.

The Treaty on European Union supplements the considerable degree of institutional independence granted to the ECB by extensive

provisions concerning transparency and accountability. Articles 253–56 (ex 190–92) oblige the European Commission to provide extensive justification for its actions, to publish documents and studies, and provide access to documents and the like. Article 110(2) (ex 108a(2)) EC stipulates that this duty apply to regulations and decisions made under Article 110 EC. Article 110(2) EC notes that, while the ECB is under no obligation to publish recommendations, opinions and decisions, it may choose to do so. The national central banks of the Eurosystem currently produce full forecasts at six–monthly intervals. As noted above, the ECB began to publish full annual forecasts in December 2000. The ECB also publishes its *Monthly Bulletin* that can be used to provide updates on policy developments, while the press conferences that follow Governing Council meetings can be used to announce policy changes if the ECB thinks that the ECB and national central bank forecasts have become too out of date to be useful.

Economists – concerned about the dangers of separating monetary from fiscal and macroeconomic policy (the 'assignment problem') – have also tended to focus on policy-making transparency and accountability as a way of helping the ECB maintain price stability by improving coordination with national fiscal and macroeconomic policy makers (Favero *et al*. 2000; Issing 1999; Mayes 2000). There is considerable disagreement as to precisely what the ECB should publish and how often it should do so. Most central banks only publish a discussion of published indicators and very few publish disagreements and voting records. Those which do so will either produce a single set of indicators or supplement them with simulations or a discussion of 'risks' or discuss the range of possible outcomes on the basis of an agreed distribution of risks. Because the ECB Governing Council has not agreed upon publishing the kinds of detailed texts produced by national central banks. The Governing Council has opted for a form of '*ex ante*' transparency that involves the establishment of a map that sets out the rules by which the ECB makes monetary policy and reacts to fiscal and macroeconomic policy developments and external shocks. The annual publication of detailed forecasts – based on what the ECB sees as the two pillars of monetary policy: a reference value for money and a broad based assessment of price developments – was begun in December 2000. However, this is only part of the required map which will include documentation on monetary models, simulation properties and a discussion of how they are used in policy formulation. Most national central banks do not publish the whole map. The Eurosystem's currently published map is, one could argue, vague and consistent with a large range of policy reactions. In order to improve transparency and

meet the demands of many observers a great deal more information must be made available.

Mayes (2000) and Issing (1999) all point out that the map will never be crystal clear: some eventualities will not be covered and monetary policy will always tend to be more contingent than other policies because of the characteristics of the decision-making procedure involved. Government expenditure can vary frequently while the formulation and implementation of structural policy is a slow process and can be altered at any time. Co-ordination between monetary and macroeconomic policy in the Euro-Zone has not been successful. As Mayes (2000) writes: 'No central bank can commit itself either to maintaining current monetary conditions or to following some explicit path in the future come what may. It can only commit itself to following a predetermined strategy' (15) (see also Issing 1999b, 517). The Stability and Growth Pact obligation to present fiscal and structural *plans* also works in this way and helps the ECB formulate its own strategy. However, effective co-ordination is inherently difficult because different policies (structural, fiscal, monetary and so on) take different lengths of time to affect the same variables (Mayes 2000, 16).

In sum, from an economic policy perspective, monetary policy should be considered an integral part of the government's overall economic policy. The government's ability to successfully deal with economic difficulties would be strengthened if fiscal and monetary policy were co-ordinated. Working from this idea, Dyson, Featherstone, and Michalopoulos suggest that the lack of linkage between fiscal and monetary policies within the EU worsens the problem of the 'insularity' of the EMU process (Dyson, Featherstone, and Michalopouls 1995). Although most governments now accept that low inflation is essential for sustainable growth, the trade-off between a bit more inflation and a bit more unemployment can still be made in the short term – especially with elections looming in the horizon. As a result of this short-term motivation, an independent central bank and monetary policy could very well lead to government frustration, friction and conflict. In this view, monetary policy and the central bank should be considered one important part of a government's overall arsenal in dealing with weighty economic problems.

Independence and accountability: a balancing act for the ECB?

It is clear that both sides of this argument carry with them considerable merit. The position of the authors is one of balance. The recognition

that the decisions surrounding monetary policy in the Euro-Zone already carry with them an almost extra-governmental aura, limits of some degree to the role citizens, the government, and interest groups should have in monetary decisions must be accepted. History provides a painful reminder to many Europeans, especially the Germans, of the dangers to the state if there exists too much 'political' involvement in monetary policy. The ECB for its part must attempt to walk a very fine tightrope between complete institutional independence and direct political accountability. When the bank pushes toward either end of the independence–accountability spectrum, conflict within the Euro-Zone will erupt. Restoring a careful equilibrium between absolute independence and close cooperation with the Euro-Zone governments will be an ongoing task of the European Central Bank.

At the same time, within a democratic order (within which the ECB operates), there must remain some mechanism of accountability to all governmental and administrative institutions and agencies. Only with some stronger mechanism of democratic accountability can the emerging European Union gain and retain the legitimacy and credibility of its constituents. The fear for many analysts of the European Union is that the EU has sold its democratic soul in return for the security that the ECB can provide in a world of globalized financial markets (Buiter 1999). The volatility, instability, and near anarchy of the global exchange markets have led the EU to contract with the ECB for some measure of monetary stability. Have EU and national leaders created a new Leviathan for Europe? If so, the ECB and the EU may be in urgent need of institutional modification.

The following section explores the level or degree of ECB independence in order to better assess the question of accountability and transparency.

The independence of the European Central Bank

Given the arguments both in favour and against central bank independence, did the Treaty on European Union create an independent ECB? Specifically, there are three distinctive contexts that we can identify within which the influence of the government, societal interests and international actors must be excluded or greatly curtailed in order for a central bank to be considered independent. These three contexts are political independence, personal independence, and financial independence (Alesina and Summers 1992; Bernhard 1998; Loedel 1999a). Within each one of these contexts, a range of possible constraints on

the ECB's independence will be analysed. In order to draw some useful conclusions about the degree of ECB independence, we compare the ECB's independence to that of the Bundesbank (before the euro).

Political independence

Perhaps the pivotal concept in the study of central bank independence is its functional or political independence. For purpose of definition, Woolley distinguishes two types of independence that prove useful here (Woolley 1984). Political independence refers to the ability of a central bank to choose a course of action independently without yielding to the pressures of others as to what that action should be. In the second sense, functional independence refers to the central bank's ability to achieve its objectives without being affected by the actions of others. Functional independence, as Woolley argues, is generally not characteristic of monetary policy (Woolley 1984: 13).[82] For our purposes, we will focus on political independence.

Political independence refers to the formal legal competence of the ECB to choose a course of action independently and without yielding to the overt or covert pressures of other political actors. By almost all accounts and universal consensus among analysts, political independence should characterize the monetary policy of the ECB. The ECB's independence is enshrined in the Maastricht Treaty – a Treaty that would be extremely difficult (and unlikely) to revise. Article 107 of the Treaty clearly states that 'neither the ECB, nor a national central bank, nor any member of their decision-making bodies shall seek or take instructions from community institutions or bodies, from any government of a member state or from any other body'. Furthermore, the Treaty narrowly defines the ECB's primary objective as maintaining price stability (Article 105). The ECB is also required, albeit in vague terms, to support the economic policies in the European Union but 'without prejudice to the objective of price stability'. The President of ECOFIN and a member of the Commission may participate on the Governing Council of the ECB, but they do not have the right to vote (Article 109b). Given the clear legal mandate, there is little chance that the ECB's political independence will be watered down in the areas it has sole responsibility.

Most significantly, the informal body made up of the euro-twelve finance ministers (originally called the Euro-XI, now known as the Eurogroup) will likely be the most consistent political threat to the political independence of the ECB. Demanded by the new French Socialist-led government in 1997, the Eurogroup concept was

presented as part of an attempt to limit the austerity measures imposed by the convergence criteria which were explicitly prolonged into Stage Three of the EMU project by the Stability and Growth pact. Within the Eurogroup, the voices and concerns of national governments regarding the ECB's monetary policies will be articulated – a necessity given the belief among the Euro-Zone members that non-euro members (UK, Denmark, and Sweden) should not have a say over the ECB's monetary policy. Resisted by the German government under Kohl, the Eurogroup has somewhat ironically become a forum of German concerns with the ECB's monetary policy, given the persistent high levels of unemployment in Germany. From the French perspective, the Eurogroup was their creation and fits within the traditional French view of a more politicized monetary policy serving national employment interests, not just price stability measures. The French also see the Eurogroup formulating positions on exchange rates (more below) as the French also tend to see the link between the price of a currency and competitiveness – albeit now the competitiveness of the Euro-Zone.

As a result, the ECB has already faced overt political pressure from national governments within the Euro-Zone to pursue a particular monetary policy. The governing council faced concerted pressure and attacks on its policies including heated pressure from the former German Finance Minister Lafontaine prior to a 4 March 1999 council meeting.[83] Along with some of the other left-of-centre European governments, Germany's new Socialist Government led by Gerhard Schröder had also raised the issue of political independence to the forefront of debate. Schröder stated that the ECB 'doesn't only have responsibility for monetary stability but also for economic growth in a sensible way'.[84] With a general shift to the left across many European governments, there has been a sense of an increase in the willingness of governments to use fiscal and monetary policy to stimulate growth and reduce unemployment. The euro's stability and the Stability and Growth Pact's credibility have in part been undermined by this manner of questioning – particularly from Germany. The ECB has responded to such pressure by indicating that it would be forced to act with interest-rate increases if governments were to fail in their attempts to keep government deficits under control.

Lafontaine and others have also criticized the bank's secretiveness and refusal to reveal the minutes of the governing board meetings. Christian Noe, State Secretary at the German Finance Ministry accused the Bundesbank – and by extension the ECB – of engaging in 'pre-democratic' behaviour.[85] The issue of transparency and accountability

is critical here. While the President of the ECB Wim Duisenberg has gone out of his way to speak openly of the ECB's policies,[86] including ongoing presentations within the Monetary Committee of the European Parliament, he has stated cogently that some measure of secrecy is needed in order to keep the market off balance. Indeed, speculation that the ECB would never lower interest rates so soon after the resignation of Lafontaine proved wrong as the bank lowered rates a full half percentage point in early April 1999. Keeping the markets and analysts guessing, and guessing wrong, are early signs of independent-minded ECB.

In summary, even with the Eurogroup body, there is no clear institutional political context within which the ECB will have to answer for its policy. As noted, the President of the ECB will be called before the European Parliament – but the Parliament lacks its own credibility among the electorate. Also as noted, the President will attend meetings of the Eurogroup where he will face questioning and possible pressure, but these meetings are also secret and will not serve a true 'accountability' forum. Moreover, as the ECB has already firmly demonstrated, it takes its price stability mandate and its institutional protection of political independence seriously. The ECB to date has not once backed down on any serious decision it has made whether on interest rates, monetary objectives or indicators, or secrecy. The ECB has had a baptism of fire in its first years of operation, but in terms of political independence, it has largely emerged unscathed and focused on its mandate of price stability.

Personal independence

Personal independence is a second crucial determining factor of central bank autonomy and is intricately related to political independence. If the members of the ECB are selected for political, ideological, and/or national reasons, one would have to question the overarching independence of the ECB to pursue its price stability mandate unfettered by national or political constraints. The ECB's decision-makers will have to assume a transnational identity and act in the interests of Europe first instead of national interest. If one senses the slightest national bias in the bank's decision-making, one would have to question whether it has established a transnational European identity and whether personal (read 'national') interest has trumped the interests of the institution.

Institutionally and personally, the ECB is a hybrid of transnationalism and intergovernmentalism. The two key bodies in the ECB are the

executive board, made up of a president, a vice-president and four additional members, each appointed to eight-year, non-renewable terms; and a governing council, comprising the Executive Board and the central bank governors of the euro-twelve members. The national central bank governors will also have, at a minimum, five-year contracts so as to ensure some continuity on the Council. The Executive Board is appointed by agreement (consensus) of the political leaders of the European Union, after consulting the European Parliament and national central bankers. The Executive Board is clearly the transnational European part of the ECB and is seen as the leading articulators of the bank's European policies. While undoubtedly interested in supporting the ECB's European price stability mandate, the national bank governors will also be representing the concerns of their respective nations. As such, they will undoubtedly bring an intergovernmental voice to ECB deliberations.

The Executive Board has not always found its footing as a strong united body pursuing the interests of the Euro-Zone. While detailed more specifically in Chapter 6, the Governing Council has at times experienced divergent views on ECB policy – especially in the area of exchange rate management. Moreover, the high-profile squabble over the appointment of its first president, Wim Duisenberg, has given some tarnish to the personal independence of the ECB. All the member governments except for the French, who desired their own candidate, Bank of France President Jean Claude Trichet, favored Mr. Duisenberg. At the May 1998 summit to decide euro participants and to finalize the 1999 launching date, Duisenberg was appointed for a full eight-year term, but 'volunteered' to step down after four years to allow Trichet to take over. Duisenberg will in fact step down after five years in office. And while no one doubts the anti-inflationary credentials of Trichet, the embarrassing episode may lead some to question the future personal independence of the ECB. Nonetheless, with the lengthy eight-year terms of office and the squabble over the presidency receding in memory, one can argue that the executive board will continue to emerge as a forceful independent and transnational voice of European monetary politics. Such a view of consensus and Europeanism is confirmed by a number of interviews conducted by the authors of the staff and leadership of the ECB.[87]

The role of the national central bank governors in ECB deliberations has been extremely important. The ECB is really the European System of Central Banks (ESCB) based on a Bundesbank-modeled 'federalist' structure. Power within the Governing Council is therefore

decentralised in favour, based on numbers, of the national central bank governors. Monetary policy decisions will be taken by a simple majority on the Governing Council. Small countries arguably could carry undue weight in the system. Austria, Belgium, Finland, Ireland, Greece, Luxembourg and the Netherlands and Portugal will between them have nine of the 18 votes on the governing council (including members of the executive board) compared with Germany's two, even through their combined GDP is only half of Germany's.[88] Not surprisingly, the Bundesbank and Bank of France Presidents have often spoken with a louder voice within the forum. One might also expect that the national central bank presidents to have their own views and data. This makes co-ordinating the ECB's message quite difficult. Therefore, the role of the President Wim Duisenberg has been especially important in moving the governing council in his and the executive board's direction – something he has not always been able to do. More problematic for the Governing Council will be enlargement and the difficulty in incorporating new national central bank governors into the decision-making process. The one country one seat on the Governing Council rule might have to be restricted (see Chapter 7 for more discussion on enlargement).

One important reason why we should still expect a generally united voice within the ECB's Governing Council on euro-policy is due to the overriding 'economic culture' of its membership (Kaltenthaler 1999). Economic culture can be see as the social perceptions that structure macroeconomic policy. Based on the membership of the executive board and most of the national central bank governors, one can argue that the ECB's economic culture is structured by a strong interest in fiscal rectitude and a deflationary macroeconomic policy targeting price stability. The members of the governing council are what most analysts would describe as believers in the benefits of an independent central bank; almost all members retained strong anti-inflationary credentials – a bank full of Bundesbankers (residing in Frankfurt no less), but even more powerful. They believe that safeguarding the value of the euro and maintaining price stability are the preconditions to a sound European economy. Too much inflation, even at an annual rate of 2–3 per cent, is seen as a cancer on the economy that will destroy the European economy over the long term. In other words, there can be no short-term tradeoffs between a little bit more inflation for a little less unemployment. Keynesian-inspired macroeconomic policy finds little if no support among the ECB's Executive Board and, in large part, the national central bank governors.

Financial independence

The third and final important aspect determining the level and degree of central bank independence is its financial independence from either the obligatory financing of government debts (internal) or exchange rate arrangements or obligations (external) such as those that existed under Bretton Woods and more recently within the EMS.[89] The latter concern is especially relevant as the euro emerges as an international *numéraire*. The euro will likely, albeit modestly, increase its role as a unit of account, a means of payment, and a store of value (Hosli 1999). If so, the euro's influence in global monetary relations will increase pressure on the ECB to stabilize the value of the euro externally.

First, regarding government financing, a government can exercise influence over and limit the discretion of central bankers if there exists the possibility that the government can finance its expenditures either directly or indirectly via central bank credits. Access to central bank credits, especially direct access, can result in an overlapping or fiscal circular flow of money into the money supply. If such financing mechanisms exist, monetary policy is by necessity subordinated to the diktat of fiscal policy.[90]

Currently, the ECB is not directly subordinated to the fiscal demands of member states. However, the bank is necessarily concerned about the potential of national governments to increase spending during the transition phase to the full implementation of the euro by 2002 – and after. For example, the ECB fears the very real scenario in which Italy, now comfortable in its inclusion within the Euro-Zone, might be tempted to fall back into past proclivities of fiscal profligacy. As a result, bolstered by the Stability and Growth Pact, which demands continued fiscal discipline within the boundaries of the convergence criteria (with exceptions for recessions) under the threat of stiff penalties, the ECB continuously warns the Euro-Zone governments to maintain fiscal discipline. While it is not impossible that member states might stray from the convergence criteria (even with Italy's additional room for fiscal spending, it remains well within the criteria), one suspects that the fear of penalties, the ongoing political commitments in each country to fiscal stability, and with the ECB ready to pounce on any divergence, states will try to hold spending steady. It remains to be seen whether a future centralized EU fiscal policy might alter this arrangement. But for now, no such scenario looks imminent.

Most importantly the ECB may face the financial constraints associated with the intervention requirements, institutional commitments, and interest rate pressure associated with exchange rate mechanisms.

Exchange rate policy for the Euro remains unclear and the debates over clarifying exchange rate policy remain extremely controversial (Henning 1997). More importantly, the ECB and the EU will face the very same choice as faced by the Bundesbank: pursue monetary autonomy (albeit within the Euro-Zone member states) or sacrifice a measure of autonomy in return for exchange rate stability vis-à-vis the dollar, yen or some other currency. The scenario sounds like one drawn straight from German monetary history: a powerful independent central bank with the goal of internal price stability pitted against an external monetary policy subject to the domain of the politicians – in the European Union, the Eurogroup, or other EU actors.

Specifically, Article 109 of the Maastricht Treaty lays down the legal relationship and general parameters between the ECB and the Council of Ministers on exchange rate policy. While still not entirely clear, it is assumed that representatives of the Council hold authority to negotiate formal and informal exchange rate agreements with foreign governments under consultation with the ECB. Formal agreements that peg the euro, for example, to the dollar or yen would require a unanimous vote within the Council after it consulted with the ECB, the European Commission, and the European Parliament. Such an arduous process of agreement or ratification will likely decreases the likelihood of increased exchange rate management at the international level. Exchange rate flexibility – or European monetary autonomy at the expense of exchange rate stability vis-à-vis the dollar or yen – will likely be the result.

Nevertheless, as Henning observes, if cohesive, 'national governments, operating through the Council, appear to hold a strong position vis-à-vis the ECB on the matter of formal arrangements' (Henning 1997: 36). While the search for consensus on exchange rate policy is required, actually attaining consensus is not required. Moreover, it is not clear which institution, the ECB, the Council or some other institution, would determine whether an exchange rate agreement would do damage to the price stability mandate of the ECB. In Germany, the government held the final say over such questions. A similar scenario for the EU depends on the cohesiveness of national governments – a pattern for which the EU national governments are not often known.

However, in an interesting set of exchanges in April and May of 1999, Tietmeyer and Trichet openly questioned Duisenberg's decision to take a hands off approach to the sinking euro. Tietmeyer (now replaced by Welteke as head of the Bundesbank) and Trichet were responding to domestic pressures in Germany and France, especially

among the general public, which had been promised a 'strong' euro, and savings and financial interests intent on preserving euro-denominated assets. In this way, Tietmeyer and Trichet were advocating 'national' interests within the supranational Governing Council. More interestingly perhaps, within the German Länder (mainly those dominated by SPD governments) and among Germany's leading export industries, voices could be heard counter to those of Tietmeyer. Parallel interests were expressed in France. The sinking euro actually was improving the export dependent economy, creating new jobs for workers, and enhancing the general Euro-Zone's competitiveness.

Moreover, informal exchange rate arrangements such as those of Plaza and Louvre can be negotiated by the Council under the rubric of setting a 'general orientation' of exchange rate policy. The general orientation must not, however, prejudice the primary objective of the ECB 'to maintain price stability'. This would suggest that the ECB would have a right to reject such orientations, although this again is not clear and will be subject to later determination under actual practice. If the ECB is bound to keep exchange rates stable – a political decision made by ECOFIN – the ECB may be forced to intervene automatically in foreign exchange markets or may be pressured to pursue an interest rate policy so as to ensure the proper exchange rate levels. In a system of freely fluctuating exchange rates, this constraint does not hold true and the central bank can pursue a policy solely concerned with domestic affairs. However, in a system of dirty floating as exists in the international monetary system, the ECB may be placed in a situation where it might have to buy and sell foreign currency or pursue an interest rate policy in order to meet some form of external exchange rate commitments. In fact, in the Fall of 2000, the ECB intervened jointly with the US and Japan in order to ease pressure on the sinking euro. This decision was made largely by the ECB and carried out by the ECB. The success of these operations were limited (see Chapter 6).

The ECB may also face pressure from the United States, Japan or the IMF to intervene in the currency markets in order to achieve a prearranged euro–dollar–yen rates (Henning and Padoan, 2000). Already the US has voiced concern about the euro's weakness vis-à-vis the dollar and what impact that is having on US competitiveness.[91] As noted at the beginning of this paper, the ECB has already found that the external scope of its monetary policy range has narrowed, certainly with the increasing integration in financial markets and with greater global interdependence. Although no formal exchange rate system currently exists between the euro and the dollar, external exchange

rate commitments may circumscribe the ECB's financial independence. For example, during his short tenure, Lafontaine sought to resurrect a 'target zone' scheme for the Euro. From the perspective of the ECB, the proposal fortunately disappeared along with Lafontaine.

Summarizing ECB independence[92]

Table 5.1 compares the independence of the ECB with that of the Bundesbank.

Table 5.1 cont'd Comparing European Central Bank and Bundesbank independence

	European Central Bank	*Bundesbank*	*Comparison*
Political	Primary Objective of Price Stability	More general mandate to 'safeguard the currency'	ECB has a more clearly articulated mandate on price stability
	Free from 'instructions' of community institutions and member states	'Independent' of the advice of the government	'Freedom' of ECB and 'independence' of Bundesbank from political pressure provide roughly similar protection for each institution.
	Mandates enshrined in Maastricht Treaty	Bundesbank Law not guaranteed constitutional protection	Hard to envision Maastricht Treaty being revised.
	Threat of pressure from Eurogroup and other actors (US, IMF).	Threat of pressure from Federal Government and domestic interest groups	Bundesbank Act had aura of 'constitutionality' but could be amended by simple majority in the Federal Parliament
Personal	Executive Board selected by consensus of member states	Directorate has eight-year terms.	Bundesbank was subject to personal issues related to Chancellor preferences, party preferences, Land Bank Presidents.
	National Bank Governors chosen by	Land Bank presidents in	Eight-year terms similar.

Table 5.1 con't Comparing European Central Bank and Bundesbank independence

	European Central Bank	***Bundesbank***	***Comparison***
	member states (majority in the Federalist structure)	majority on council; Federalist structure	
	Eight-year terms (non-renewable) on Executive Board	Strong sense of German monetary culture *Stabilitätsgem-einschaft* (culture of stability)	ECB will face similar pressures, but culture of central bankers will be strong – like Bundesbank – but maybe no culture of stability within the European public? Conflict over Duisenberg embarrassing; will likely not affect independence
Financial	Not required to finance government debt	Bundesbank not required to finance government debt	Bundesbank and ECB have to deal with government spending.
	Must contend with member state budgets (strengthened by Stability and Growth Pact)	Had to contend with government spending.	Similar scenario for ECB and Bundesbank on spending since con vergence criteria in place.
		Required to hand over profits to government	
	No centralized European Union budget	Finance Ministry controlled exchange rates	Bundesbank faced more exchange rate pressure within EMS.
	No formal (external) exchange rate commitments	Often found itself constrained by exchange rate regimes (Bretton Woods and EMS)	ECB will face possi ble exchange rate pressure as ECOFIN controls exchange rates; No strong pressure currently
	Possible exchange rate pressure as ECOFIN controls exchange rate policy		

First, in terms of political independence, we can state that the ECB has perhaps an even greater level of independence than that of the Bundesbank, at least as based on the statutes creating the ECB. The role of the Eurogroup remains a bit of wild-card, but given the first example drawn from the clash between LaFontaine and the ECB and other rather weak efforts on the part of the Eurogroup to speak with one 'political' voice vis-à-vis the ECB, the ECB has maintained its political independence with full vigour and clarity. Moreover, the ECB's statutes are part of the Treaty on European Union – and will not be subject to revision (other than when enlargement becomes problematic). The constitutional protection for the ECB remains indeed stronger than the Bundesbank's own constitutional protections (simple majority vote could change the Bundesbank act). The ECB, however, does not operate in a complete political vacuum. The bank's decision to lower rates in April 1999 (after Lafontaine resigned) and May 2001 (following US and IMF pressure) does show a pragmatic political side to the bank. Nevertheless, the ECB appears to be the model for a political independent central bank.

In terms of personal independence, the ECB faces some complementary concerns that often plagued the selection of personal on the Bundesbank. The much-cited problem with Wim Duisenberg's appointment does raise some concern about future manipulation of the selection process. These concerns have been raised again given the speculation over who will replace Duisenberg in 2003. But we would contend that the overriding economic culture of the Governing Council will moderate any concerns about national bias or national governments manipulating the selection process of Governing Council members to serve national or personal interest. More interestingly, perhaps, is the role that the national central bank governors will play in the determining the outcome of ECB policy. While most if not all of the current governors subscribe to the dominant economic and monetary culture of European central bankers, if more difficult economic times develop national interest may increasingly play a role in the decision-making dynamic of the ECB. German preferences may diverge from Irish or, imagine in the future, British preferences. To date, while not always speaking with one voice, the ECB has chosen to act in consensus and avoided the appearance – through the decision not to take any published vote on interest rates – of division within the Governing Council. One could speculate that the Executive Committee is fearful of being outvoted by the national central bank governors. For now, these issues are still

difficult to assess but will not likely weigh significantly in the ECB's independent room for manoeuvre.

Financial independence is a bit more complex and depends on whether one examines internal or external sources of constraint. Even with the decision in mid-1999 to relax some budgetary constraints on Italy (the Germans' worst nightmare), internal financial independence appears for the moment to be quite strong. However, even with the Stability and Growth Pact, modest economic growth in Europe, and the overriding commitment among the Euro-Zone members not to stray far from the price stability model, especially during the transition phase to 2002, the ECB will still expect in the near term to face mounting budget deficits among member states. External financial constraints, in the form of exchange rate pressures and the declining euro, will continue to pose very difficult and serious dilemmas for the ECB. While no formal exchange rate agreement between the euro and the dollar, for example, currently exists – providing the ECB with greater policy latitude in the near term – the euro's problems accentuate the concerns over democratic accountability and the bank's own monetary credibility. The last section of this chapter focuses largely on these external policy dilemmas.

In sum, the ECB has in many respects – political, personal, and financial – to have at a minimum the same level of independence as the Bundesbank. In some areas, particularly political and financial independence, the ECB can be seen as perhaps maintaining even greater amounts of independence (see also, Elgie 1998). In its brief history, the ECB has already established itself as an independent actor focused on its primary objective of price stability. However, internal pressure from the Eurogroup, national governments, and external exchange rate pressures will make the ECB's balancing act a difficult one indeed. Here we must return to the question of credibility – developed in Chapter 6.

Institutional expectations of the ECB

Based on the above analysis, European monetary politics under the ECB will take on the institutional dynamics of the German model – a highly independent central bank (the ECB) obligated to pursue price stability as its primary objective within the Euro-Zone member countries. The objective of price stability is potentially constrained, however, by political institutions within the structure of the EU and external exchange rate arrangements governed by the ECOFIN or some other body like the Eurogroup.

Initially, the euro will be less vulnerable to speculative attacks that often beset the old ERM.[93] However, the steady slide of the euro from 1999–2001 has confronted the ECB with the dilemma of accepting depreciation of the euro vis-à-vis the dollar (and the inflationary impact of the depreciation) or raising interest rates that might force one or more euro countries deeper into recession, and conceivably, one might argue, out of EMU. Or, the ECB might have to engage in exchange rate politics within a reformed G-7 (and IMF) that would require intervention to shore up the euro within various ranges or zones. Given the fact that each Euro-Zone member has forgone using exchange rates as an instrument of adjustment, conflict among euro countries and conflict between the ECB, ECOFIN, euro-member countries and non-euro members like the UK will likely erupt. The decision to stick with the euro in difficult times will ultimately be a political one. Much will depend on the public's acceptance of the sacrifice of their particular currency for the historic leap to EMU and the euro. The member countries, the European Commission, and ECB will have to continue their public relations campaign. Neither the euro nor the ECB will be de-politicized. The euro will be by definition politicized and, in many ways, it will still retain a nationalized context through the EU's traditional governing institutions.

The lessons of Bundesbank independence should not be lost on the ECB, European Union officials, EMU member countries, or the European-wide public. The ECB will be more powerful and independent than even the Bundesbank. The ECB's mandates for price stability are unambiguous. Its political independence is unquestioned. However, unlike the Bundesbank, which did have a political counterweight in the form of the German government, a political counterweight of any importance does not exist – the Eurogroup notwithstanding. The euro will thus be a challenge to all Europeans to accept the implications of a stability-oriented monetary union. More precisely, does a *Stabilitätsgemeinschaft* exist in Europe that would be willing to accept the costs of a strict price stability policy? We know that the German economic culture supported such a mandate and undoubtedly supports the same mandate for the ECB. But no such consensus or European economic culture exists across the EU. While the Bundesbank could call upon a collective German understanding of the problems of inflation, the ECB will not be able to call upon a similar collective European understanding. As such, it will make the ECB's initial actions more difficult than the Bundesbank's own early efforts at securing public support for its price stability policies. This difficulty will be accentuated by the likelihood that the ECB will first

pursue an aggressive anti-inflationary monetary policy in order establish its credibility in the eyes of the markets.[94]

Furthermore, clarifying how exchange rate policy will be determined is undoubtedly a difficult task. If the lessons of German monetary politics are of any relevance, the degree of political control that the Eurogroup (or some other body) has over the ECB in the matter of exchange rate policy will be crucial to determining the full extent of ECB independence from the political fetters of exchange rate policy. The Eurogroup has only begun to detail some of the conditions that it would pursue an exchange rate policy. As agreed to at the Luxembourg summit in December 1997, the conditions that could lead to the development of an exchange rate policy are cited as 'definite exchange rate distortions'.[95] These conditions were, however, not clearly defined. Nor was it determined who would decide when exactly such 'distortions' demanded action. Without prejudicing price stability or the independence of the ECB, it is thought that the Eurogroup will undertake this role. With consultation with the ECB and Commission, the Eurogroup will act to formulate a policy. How this all will develop over time remains unclear.

Specifically, informal exchange rate agreements will likely not find much support within the ECB and will thus have a limited impact on the ECB's monetary policies since the bank will likely find it easier to disregard such arrangements and/or frustrate any new initiatives. With weak governance structures of the G-7 existing today, the European Council will have a low level of political leverage over the ECB to go along with any exchange rate initiatives coming from the G-7 forum. As a result, given the difficulty in securing the ECB's support for such arrangements, we should expect ECOFIN to be hesitant to enter into any serious exchange rate negotiations. Assuming that the Council is responsible for negotiating exchange rate agreements, we should not expect any new major exchange rate initiatives in the international monetary arena.

We would argue that the experiences of German monetary authorities under the Bretton Woods system now frame the ECB's view toward the international monetary system. Proposals to resurrect some new form of global monetary regime (a fixed exchange rate system, a gold standard, and a basket of commodities) will be met with a large measure of scepticism and rejection by the ECB. The ECB will likely not be interested in returning to a system that might undermine the its efforts to maintain European price stability or the EU's efforts to solidify and enhance the processes of collective European monetary cooper-

ation. Automaticity and supranationality, at least at the international level, are not concepts that are accepted easily among European central bankers. The ECB will likely prefer not to rely on mechanical rules, obligatory standards, or automatic guidelines in external monetary affairs. Price stability and securing the value of the euro will take priority over exchange rate objectives. If it has not already, the German monetary norm will likely become the European monetary norm guiding Europe's exchange rate policy.

Conclusion

Even with the exceptional amounts of independence, the ECB sees its status and its policies as accountable and transparent. This view is not shared by all – the public, the markets, and national governments. While no one suggests anything that might undermine the ECB's mandate on price stability or that threatens its independence, many argue that the ECB must make a better effort to legitimize its policies with the public and the markets. While the ECB's interest rate policy has, by most accounts, been appropriate to the conditions of the Euro-Zone, it does not mean that all has been smooth sailing or without negative consequences. As a result, some analysts go further and demand stronger democratic controls and constraints in the form of EU institutional checks on the ECB.

Our analysis suggests a stronger effort on behalf of the national governments, the European Union, and the ECB to sell the policies of the ECB and the benefits of the euro. We accept the notion of an independent ECB (and its requisite desire to focus on price stability and monetary targets), but also recommend increased efforts to balance the ECB's policies with political input from national governments, the Eurogroup, and the European Parliament. Until a proper balance of independence and accountability can be achieved, the ECB will continue to find itself exposed politically in the rapidly transforming political and economic context of the Euro-Zone and the European Union. This exposure will cost the ECB some of its credibility – to say nothing of the entire process of European integration.

6
A Question of Credibility: a Short History of ECB Monetary Policy

> Any monetary policy that lacks credibility must be paid for with higher interest rates. The expectations of a well-informed and fundamentally critical general public must not be disappointed. Central banks have to take this into account in pursuing their policy; above all, they should take care not to exacerbate any prevailing uncertainty through their own policy.
>
> Otmar Issing, ECB Governing Council[96]

> Monetary policy is a matter of confidence. You don't get confidence for nothing; you have to work and earn it. It's a great effort for us at the Central Bank to explain why we are doing it. I believe we are more open, more transparent than any central bank in the world.
>
> Wim Duisenberg, ECB President[97]

Introduction

As noted in the previous chapter, credibility centres on whether and how central bankers can make credible commitments about their future conduct. Importantly, central bank independence and the credibility that flows from it needs to be understood in terms of actual policy and behaviour. It is one thing to proclaim a central bank independent – and, as we have demonstrated, the ECB maintains high levels of independence. It is another thing to proclaim the central bank's policies credible. Monetary policy credibility must be measured over time and must be evaluated in terms of the monetary policies and behaviour of the bank. Moreover, the structure of the economy and

internal politics may present the ECB with difficult tradeoffs between short-run policy benefits and long-run policy costs that may have an impact upon credibility. Such tradeoffs present the central bank with difficult policy choices that will be analysed in minute detail by politicians and markets alike. Such choices are the basis of evaluating central bank credibility.

Are the ECB's policies credible? Has it earned the same level of credibility that the Bundesbank, for example, earned over its long history? One could argue that the ECB's interest rate policies have remained largely consistent over the period 1999–2001; in fact the bank's interest rate policies have, some would argue, benefited Europe's economy by maintaining control over inflation. Its mandate of price stability has largely been fulfilled. However, the ECB's credibility in terms of communicating a consistent message, formulating a coherent monetary strategy, and developing a clear line on exchange rate management has suffered noticeably. In one sense, the euro's weakness vis-à-vis the dollar (losing over 20 per cent of its value since 1 January 1999) indicate that the ECB's credibility has deteriorated due to the varying pressures coming from the markets, the public, and politicians. Currency traders and other ECB watchers point to a number of public misstatements and other communication gaffes by Duisenberg and the Governing Council. These statements, coupled with the apparent inability of the ECB Governing Council to speak with a single voice in public, have exacerbated existing uncertainty in the market and the public about the euro project. Finally, the lack of clarity over which EU body is responsible or accountable for the external valuation of the euro has also eroded some of the bank's reputation.

This chapter analyses the actions of the ECB starting in mid-1998 when the ECB came into its formal institutional role through the launching of the euro on 1 January 2002. While not every action and policy shift is highlighted in detail, the analysis focuses on the major flow of ECB policy. Although discussed in the chapter, our analysis is not necessarily focused on whether the ECB has acted independently without regard to political pressure. Indeed, the ECB has consistently resisted any pressure for rate cuts. Rather, our focus is on the credibility question. Despite an independent track record, credibility has not flowed easily or smoothly to the ECB. Answering this question is crucial to developing a comprehensive understanding of the policies and politics of the ECB.

Our analysis also must also be tempered by the relative short history of ECB policy-making; however, some basic trends and patterns have

already emerged. Using the framework of policy credibility and our earlier analyses of the independence of the ECB, we highlight the twists and turns and ups and downs of the ECB as it has struggled to find solid footing in the slippery world of globalized foreign exchange markets and political trap doors. From the initial pressure on its independence, to the crisis of the weakening euro (and its first forays into intervention), to the ongoing question of transparency, the ECB has had a difficult start.

At the same time, the fact that the launching of the euro on 1 January 1999 was a notable success and the fact that the ECB has found more solid footing give grudging acceptance to the notion that the ECB has learned from earlier missteps. Moreover, the ECB has carefully struggled to balance political input and an independent policy so as to assure its long-term credibility on the key issue of price stability. Moreover, we contend that the ECB has found a stronger focus with the generally successful changeover to the euro on 1 January 2002. With an emphasis on the introduction of notes and coins, the ECB's power and competence should come into sharper focus as well.

The ECB gets started: early controversies and successes

Commenting shortly before taking office on June 1998, Duisenberg suggested that the ECB would not conduct an 'extra tight monetary policy' just to make the ECB more credible. Credibility 'must be earned. You do not gain it in one day'.[98] Nevertheless, with money supply targets (based on the broader measure M3) above 5.5 per cent annually, some senior European monetary officials were suggesting that interest rates would have to go up in the third or fourth quarter of 1998.[99] While prediction was difficult, estimates of the official ECB interest rate for the launch of the euro stood somewhere between 3.5–4 per cent. At the same time, others commentators – mostly politicians and government ministers – warned against stifling economic growth which stood at a sluggish 2.5 per cent across the Euro-Zone.[100] Almost immediately upon inception, the ECB was thrown into the middle of a classic monetary dilemma: raise interest rates to satisfy the currency traders and monetary hawks in national central banks or keep rates stable (or even lower rates) and satisfy the politicians. Whichever side the ECB came down on, it would immediately be placed in the pressure cooker of European politics.

In addition to facing possible problems over its early stand on interest rates, the ECB was warming to its first public confrontation with

Euro-Zone governments over public spending. In a July 1998 ECB announcement, Duisenberg stated bluntly that governments in the Euro-Zone should aim to run balanced budgets in accordance with the mandates of the Stability and Growth Pact. Fiscal profligacy would, according to the bank, have negative consequences for monetary policy – a thinly veiled threat of higher interest rates. More specifically, he suggested that countries with particularly high levels of national debt should be running surpluses.[101] Furthermore, Hans Tietmeyer, still at the helm of the Bundesbank, supported Duisenberg by suggesting that some states – including Germany – would soon be in the danger of running an inappropriate fiscal–monetary mix. Even with inflation virtually absent and economic growth just starting to pick up, the ECB was staking out what it argued was the higher ground in any future debate on monetary policy and fiscal policy.[102]

Taking the financial markets by surprise, on 3 December, the Bundesbank, followed by the 10 other central banks of the countries that were to join EMU on 1 January 1999, cut interest rates. Based on the earlier statements of Duisenberg, economists had largely predicted that there would be no interest rate changes before the 1 January launch date. The economic data supporting a rate cut was mixed (low inflation, sluggish growth – but money growth slightly above targets) and the reliability of Euro-Zone data was still an unanswered question – an early indicator of the troubles the ECB would face in communicating its strategy and decisions to the public and the markets. Nonetheless, the Bundesbank cut its repo rate from 3.3 to 3 per cent. The other euro countries trimmed their interest rates to the same level. Italy cut its rate to 3.5 per cent under the assumption that its rate would converge to 3 per cent by 1 January. One explanation for the co-ordinated rate cut was to signal the markets prior to the launch that all Euro-Zone members were strongly committed to the success of the euro. It would also likely ease pressure off the ECB to cut rates at its first meeting in January. Finally, the ECB also mentioned the ongoing monetary and financial troubles in Asia, Russia and Turkey that might put a drag on economic growth in Europe. Despite widely different explanations for the co-ordinated move, a statement issued by the ECB suggested that the decision was the result of a 'common assessment of the economic, monetary and financial situation in the euro area'.[103]

One can perhaps interpret the rate cuts more cynically. The decision was the national central banks' last moment of power as interest rate policy would then slip beyond their sovereign control. In its last decision as the sole protector of German monetary stability (and true to form),

the Bundesbank argued that strict monetary considerations were behind the decision to lower rates. The decision was a 'sovereign decision of the Bundesbank that was uninfluenced by political expectations … We are deaf to political pressure, but not blind to arguments and facts'.[104] For Tietmeyer, the move to co-ordinate interest rates and to move them in line in anticipation of the launch date was desirable based on low inflation levels in the Euro-Zone. The Bundesbank was adamant that it was still in sovereign control of German monetary policy and still firmly independent in its capacity as a national central bank.

One reason for the Bundesbank position was the increasing political pressure on the ECB that had been coming from the new German Finance Minister Oskar Lafontaine. Discussions between Lafontaine and his French counterpart, Dominique Strauss-Kahn, over co-ordinated economic policies and target zones for the euro signalled the turbulent time to come once the euro had been officially launched. Lafontaine envisioned the Euro-XI group as a political counterweight to the ECB (and as a symbol of the price the United Kingdom would have to pay for remaining outside EMU). For Lafontaine and others in the leadership of the new German government, questions needed to be raised in terms of the public interest – not the narrow monetary or financial interests advocated by the ECB and the Bundesbank. As Lafontaine suggested, 'we have to carefully ask ourselves: does our monetary policy hinder the reduction in joblessness or not?'[105] Raising these issues could, according to Lafontaine, be legitimately done in the Euro-XI forum. As the ECB began its activities in July, the Euro-XI also held its first meetings. France pressed for a body that would meet regularly, schedule a rough timetable for future meetings, develop more reliable Euro-Zone economic statistics (perhaps in competition with the ECB), and reach an understanding on contacts with international bodies such as the IMF. With strong resistance from the Bundesbank (and Great Britain on the sidelines), the more moderate Socialist German Chancellor Gerhard Schröder did not fully support France's or Lafontaine's efforts to build the Euro-XI into a de-facto decision-making body. As it would turn out, the Euro-XI (Eurogroup) would remain largely impotent and without clear guidance as an effective counterweight to the ECB.

Launching the euro: 'an abrupt change in regime'[106]

The launch of the euro truly marked a momentous change in terms of monetary governance in Europe; the ECB would now have sovereign

control over interest rates within the Euro-Zone and currencies would be permanently fixed. Despite the historical nature of the change, the ECB would have no honeymoon period in which to act. 'Extreme uncertainty', as one EC banker noted, pervaded the minutes before the launch. But the fact that nothing dramatic happened was an indication of the relative success of the euro's birth. The target system of payments was up and running and the ECB was calling bids on 13-day refinancing agreements. All appeared normal accept Duisenberg's interview in a French newspaper indicating that he might not retire after four years.[107] In its first full day of trading, the euro opened at 1.17 and climbed to more than 1.19 before settling at 1.18. Stock markets in Frankfurt, Paris, Milan, and Madrid all jumped by 5 per cent or more. Banks reported minimal problems as they spent most of the weekend prior to the launch reprogramming computers to use euros. The long anticipated day had come and gone without a hitch.

Despite the relative smooth start, with no honeymoon period or '100 days' to seize the agenda, the ECB was immediately having to defend its policies. Shortly after the launch of the euro, the ECB's Vice President Christian Noyer was questioned in an interview about the ECB's independence. Given the pressure coming from France and Germany and the co-ordinated effort to lower rates in December of 1998, had the ECB given in to political pressure? Noyer responded that the ECB did not cave in to German and French demands for a decrease of interest rates. Given the sluggish Euro-Zone economies, Noyer focused instead on the fact that inflation was well under the target rate of 2 per cent – giving the Euro-Zone central banks room to lower rates. Noyer argued that the 2 per cent inflation target was useful because 'it is what the people believe is stable prices',[108] and that the ECB would focus its energies on attaining that goal. Noyer went on to warn states of going beyond the limitations of the Stability and Growth Pact and cautioned, too optimistically in retrospect, about the possible effects of a strong euro on exports.

Noyer's comments would become the theme of the ECB's first six months in office. German analysts in particular were watching the ECB with a keen eye and with a focus on the transparency and clarity of the ECB message. For German ECB watchers, the key was the '*glaubwürdigkeit*' – or believability – of the ECB.[109] The more believable the bank, the more transparent would its policies be. The ECB would still need to earn the same level of believability that the Bundesbank had established over the last 40 years. For German ECB watchers, the monthly reports of the ECB would be crucial in laying out a strategic

vision for the ECB's monetary policies.[110] This fact was not lost on the ECB. Showing its debt to the Bundesbank, in its first monthly report, the ECB launched a renewed broadside against the spending policies of the Euro-Zone governments. The ECB also warned of lower economic growth as a result of economic troubles abroad, indicating a possible softening view on interest rates, but its aim was primarily at the socialist-led governments in France and Germany. From the ECB's perspective the government's of the Euro-Zone still maintained weakened commitments to fiscal discipline.

With no ECB movement on interest rates, February and March continued to be dominated by the debates over the Stability and Growth Pact's requirements that governments restrain their budget deficits to under 3 per cent of GDP. The pressure on the newly elected Social Democratic government of Gerhard Schröder and his fiery finance minister to do something to stimulate employment in Germany intensified as economic growth remained sluggish. As Lafontaine stated, 'if the monetary authorities cannot find a response to the negative shock to demand, other options will have to be considered'. The thinly-veiled threat to the ECB indicated Lafontaine's intention to push for a fiscal stimulus package. The French Finance Minister Strauss-Kahn was also pushing an idea of a euro-wide standard for the 3 per cent budget cut-off. If the Euro-Zone budget deficits – taken together – remained below 3 per cent, then individual countries could briefly surpass the 3 per cent GDP mark. The idea was floated among the Euro-XI as a possible strategy to counteract the ECB's perceived hard line monetary policies. The implication: Germany and France might be able to spend more if the combined Euro-Zone cut-off stayed at or below 3 per cent – supported by fiscal discipline in the Euro-Zone's growing economies (Ireland and the Netherlands, for example).

The spectre of Germany and France falling short on the budget deficits haunted the ECB and raised doubts about its ability to withstand the political pressure. It was becoming immediately clear that the Euro-Zone, despite the conservative ECB at its core, faced an urgent problem of draining credibility. The ongoing conflicts and public divisions between the ECB and Euro-Zone finance ministers (especially in France and Germany) hurt the external value of the euro and indicated that a strategic long-term view of the Euro-Zone's future was lacking.[111] As one currency analyst suggested, '[t]he loss of credibility is a slippery slope. Once you start down the slope and lose traction, it is hard to crawl back up again'.[112] Some hoped that the new European Commission President Romano Prodi could bring some stability and

order to the EU's policy-making process and encourage fiscal consolidation, as demanded by the ECB, among member states. Some felt that Prodi's own experience in bringing Italy's fiscal side under control would add some credibility to the EU's own efforts to restore financial order. The reality, however, was that there would be little that Prodi or the Commission could do to control France or Germany.

In addition, through the first few months, many analysts were focusing on the inevitable question of when the ECB would actually make its first decision on interest rates. In which direction would it go and when? Speculation was rampant. For example, the decision on 19 March to keep interest rates unchanged found the ECB in the classic dilemma: Did the ECB keep interest rates stable in order to look independent? Or should the ECB have lowered rates – as many economic analysts, not just Lafontaine – were arguing? The ECB was in a no-win situation. Was it not acting just for the sake of not acting or should the ECB have made a decision based on the real economic needs of the Euro-Zone? Not only was pressure coming from member states, but the ECB was also receiving calls from the IMF to lower interest rates (although divisions in the IMF board revealed a decidedly Anglo-European continent split on euro interest rates). The pressure on the ECB to act was intensifying.

The cloud of controversy surrounding the ECB lifted briefly with the resignation of Oskar Lafontaine in March. His resignation was seen at the time as a major triumph for the ECB in securing its political independence. Internal SPD rifts between the more moderate Schröder wing and the left-wing Lafontaine led to the resignation – but certainly Lafontaine's ongoing efforts to hem in the ECB with pressure for rate cuts and exchange rate target zones further exacerbated the split. With Lafontaine gone, the ECB regained its political footing. The bank warned in its March *Monthly Bulletin* that the financial and structural policies of the Euro-Zone member states were not focused enough on deficit reduction. The report went on to conclude that further fiscal and structural reform was needed. The ECB's opinions, one could argue, expressed avowedly political point of views. Was this a signal of renewed confidence in the ECB?

Yet even after Lafontaine's exit (and the euro rising 2 cents in a day), the euro continued to sink in value as April proved a difficult month for the ECB.[113] Duisenberg tripped himself up repeatedly.[114] Shortly after the 8 April decision to lower rates (to 2.5 per cent – more than was expected), Duisenberg stated emphatically that the decision to lower rates ruled out any further rate changes for the foreseeable

future. However, within several weeks, new signals from the head of the ECB indicated the possibility of further rate changes (albeit it was not clear in what direction). Moreover, references in the media to the effect that not all members of the governing board were enthusiastic about the April rate cut also raised some concern among ECB watchers. More problematic, however, was Duisenberg's comments stating that he was not worried about the euro's decline. Referring to an ECB policy of 'benign neglect' vis-à-vis the euro, Duisenberg sparked renewed sell-offs of the currency. In order to address the concern that the ECB was out of touch with the public's view of the euro, at the G-7 meeting in Washington at the end of April, the Germans sought to shore up the ECB's credibility. In particular, Hans Tietmeyer, then Bundesbank President, explicitly renounced Duisenberg's reference to 'neglect'. Specifically, Tietmeyer stated that 'a policy of neglect would be inappropriate, and I would like to add that, all in all, a significant further change in the euro's level would not be appropriate'.[115] Verbal discipline was now needed more than ever or else the ECB's traction would continue to slip down the slippery slope of credibility.

By May 1999, the euro had lost 10 per cent of its value against the dollar. Despite some pressure to act, the ECB resisted. Otmar Issing, Governing Board Member and chief economist on the board, stated bluntly that concentrating on the exchange rate so soon after its launch would be a mistake. Issing implied that there existed in the media and the markets a far too narrow focus on exchange rates. 'Everything we observe is either a historic low or a historic high'.[116] At the same time, there was increasing talk of co-ordinating exchange rates in some fashion or another, although the idea of target zones had disappeared along with Lafontaine. Sirkka Hämäläinen, one of the ECB's directors, suggested the possibility of increased exchange rate and, in general, macroeconomic co-ordination between the Euro-Zone, the United States, and Japan.[117] The context of global monetary instability and financial crises in Asia and Russia stimulated active discussion about the role of the big three financial powers and how they could bring some stability to the international monetary system. Indicative of the problem of co-ordination was the ongoing problem of devising a clear role for a Euro-Zone representative to the IMF or the G-7. Would the ECB president speak on behalf of the Euro-Zone members (Italy, Germany, and France) within the G-7? These issues had not yet been settled.

Brushing off some of the earlier criticism, in an interview in late May, Duisenberg expressed his personal confidence in the euro and his

view that the overall first months of the euro experiment had been successful. He noted that the pressures on the euro could be explained by stronger US economic growth and the crisis in Kosovo as the dollar remained a safe haven in times of crisis. Duisenberg also indicated that the euro had settled into a more normal and constant phase of valuation – given the euro's rise (albeit brief) after the immediate launch of the euro. Moreover, he suggested that the ECB could not intervene verbally on behalf of the euro, that such actions would be counterproductive and damage the credibility of the ECB. Finally, with interest rates at record lows, it was not surprising that the euro was weak. The weak euro in fact supported the general economic developments of the Euro-Zone (especially through strong export-led growth) without threatening price stability. Economic growth, low inflation, and the euro's emergence as one of the world's main investment currencies were clear indicators of the euro's successful launch. In Duisenberg's view, the situation was quite good, the record of the ECB solid.[118]

Duisenberg could not rest on his own positive assessment for long. Concern among the ECB watchers, the markets, and the German public was generated by a deal agreed upon by ECOFIN for Italy that relaxed its 1999 budget deficit target from 2 to 2.4 per cent. This decision increased fears that fiscal discipline would weaken throughout the Euro-Zone now that the launch of the euro had been relatively successful. In addition, statements by various ECB leaders appeared contradictory on the issue of the euro exchange rate. The lack of a single voice gave evidence to support the contention that leading ECB officials did not talk among themselves, let alone speak coherently with the market. At this early stage, no one was suggesting currency intervention as a solution to the euro's weakness. For ECB officials, intervention would only further damage the bank's credibility. The common (and correct) view was that the ECB could not reverse the trend, only support a trend (swim with the current, not against). By the end of May, only the Bundesbank had taken on the role of leading euro cheerleader trying to stave off euro parity with the dollar.

At the Cologne European Union summit on the weekend of 5/6 June, attempts to speak with one voice were undermined by further differences over the wording of a statement that sought to boost the euro. The 15 heads of government sought to expunge wording in a draft communiqué that made reference to the euro's decline. But the draft had already been widely disseminated and reported upon in the media. The appearance of summit disarray

permeated the press.[119] The situation was further complicated by a speech by Commission President Prodi indicating the possibility, at least theoretical, that Italy might have to exit EMU if it could not keep costs down and its finances in order. Was Prodi speaking for Europe? Or for Italy? Or was he speaking on behalf of the euro? The cacophony of differing statements and opinions on the euro was eroding public and market support for the currency.

Largely as a result of the global financial crisis and banking failures in Japan and the US, another controversy erupted over the issue of whether the Euro-Zone area had adequate power to regulate the increasingly dynamic Euro-Zone financial system and banking industry. As consolidation and mergers became the dominant strategy of the financial services industry, the ECB argued that it had to increase its regulatory oversight of this industry in the Euro-Zone. Some members of the ECB envisioned something along the line of a central 'European Financial Regulatory Committee'.[120] Some of this thinking was based on the work of Barry Eichengreen (see Eichengreen 1993; and 1998). Eichengreen noted in his own work on the Federal Reserve that the lack of a strong centralized regulatory framework for the US contributed to the financial chaos and crisis of the Great Depression. Eichengreen and others warned that the ECB may be in a similar situation because it would not have enough power to deal with a crisis euro-wide – especially through the emerging euro-financial markets. While no such crisis has yet emerged, the potential for a problem certainly does exist in the Euro-Zone. The issue of banking and financial services regulation would continue to be one of the more controversial issue areas still to be addressed by the ECB and EU members governments.

National central banks, however, were resisting the idea of a centralized European Regulatory Committee. In particular, the Bundesbank advocated a decentralized system emphasizing national control. For the Germans, the decentralized system of regulation best served the German financial industry (and large banks). Besides, the Bundesbank (and some of the Länder central banks) would still retain some power that it felt was increasingly slipping away toward the ECB. Moreover, the principle of subsidiarity, a concept the EU was always constantly trying to promote, laid the groundwork for a decentralized confederal structure to EU governance. Besides the ESCB was based on an existing decentralized, confederal model. Why reinvent the wheel? The division within the ECB's own ranks was symptomatic of a new institution going threw growing pains.

The euro's continued slide (July–December 1999)

Discordant notes among the ECB's Governing Council continued to have a noticeable effect on the value of the euro. With the replacement of Hans Tietmeyer with Ernst Welteke as head of the Bundesbank, differences of opinion between the Bundesbank, the ECB, and the French central bank on the value of the euro emerged. During the summer of 1999, Welteke suggested that the euro find a target of around 1.05 euros to the dollar. According to Welteke, such a value would be appropriate given the existing macroeconomic conditions of the Euro-Zone. This view reflected, one might suggest, the usefulness for German exports of the weak euro. At the same time, Jean-Claude Trichet, the President of the Bank of France, argued that the euro had room to appreciate, reflecting in part the fact that the French economy was doing better than the German. And as the *Financial Times* suggested, 'it also underlined France's long-term goal of making the euro a rock-solid currency capable of challenging the dollar's supremacy'.[121] Differences also emerged between the ECB (and its Vice President, Frenchmen Christian Noyer) and Germany over the proper direction of interest rates. Christian Noyer testified to a European Parliament committee that there might be a need to raise interest rates given monetary aggregate targets that were rising above the loose reference target of 4.5 per cent. Welteke responded that he saw no reasons for any shift in interest rate policy and downplayed concerns about the money supply. Ironically, it almost appeared that traditional monetary roles were now being reversed – France as the inflation hawk and Germany appearing 'soft' on inflation. For his part, Duisenberg was caught in the middle trying to balance competing views on the euro's value and ECB's interest rate policy.

In an interesting study cited in the *Financial Times*, an analysis done by an economic consultancy group, 4Cast, found an inverse relationship between the number of official statements on the euro and the performance of the currency.[122] The three quietest periods for official ECB comments in the year 1999 had coincided with relative stability or appreciation for the euro against the dollar. Of course it was also possible to suggest that ECB officials only were asked to comment on the currency during episodes of weakness or instability – thus triggering the relationship discovered in the study. Whatever the direction of causality, the problem was clear: the credibility and communication strategy of the ECB had yet to be effective.

Driven in part by what it felt was a weak public front for the euro, members the Euro-IX decided that more co-ordination and coopera-

tion in its activities were necessary. The Finnish presidency of the EU in the second half of 1999 and its chairing of the Euro-XI group helped formalize some of the activities that the French Finance Minister Strauss-Kahn had initiated earlier. Strauss-Kahn, who resigned in November of 1999, had steered the group in more structured discussions and informal agendas were prepared with the chair guiding the debate. Suaili Niinisto, Finland's Finance Minister, took Strauss-Kahn's developments a bit further. Niinisto developed a strategy of informally summing up the discussions at the Euro-IX meetings. He would also write follow-up letters to fellow ministers, summarizing any policy advances or problems and suggesting points for later meetings. Better organization was matched with more serious, less flamboyant ministers including Hans Eichel (replacing Lafontaine) and Christian Sautter of France (replacing Strauss-Kahn). The forum would prove useful to explain domestic policy problems and to employ the backing of colleagues in the Euro-Zone to add to each finance minister's political influence at home when arguing for controversial policies such as spending cuts. The Euro-XI group also took a more active role in verbally boosting the euro.

Building on these concerns the Finnish Prime Minister Paavo Lipponen, who held the presidency of the EU, suggested that 'in articulating its monetary policy objectives, the ECB falls short of the ideal. Clearer objectives are needed'.[123] In particular, Lipponen focused on the ECB's two-pillar strategy and strongly suggested that the ECB publish economic forecasts so as to remain a 'credible partner in economic policy dialogue'. Lipponen's comments were echoed in Germany by a report released by the so-called 'five-wise men' – the German government's council of economic advisors – who recommended in their annual report that the ECB abandon the two-pillar strategy. 'Only with a clear concept will the ECB be able to maintain a strong reputation over the long term as a guarantor of stability of the value of money'.[124] Internal splits within the ECB, however, over the wisdom of publishing forecasts, given the continuing uncertainty over how the money supply had been affected by the launch of the euro, precluded any immediate movement in that direction.

Despite the political and market pressures, most analysts believed that the concern over the slide of the euro was 'much ado about little'. In terms of domestic purchasing power, in terms of boosting exports, in terms of a longer-term perspective on the value of the euro, the picture was not too worrisome. 'One euro is one euro', according to Duisenberg.[125] Moreover, with a November interest rate increase from

2.5 to 3 per cent – the first increase by the ECB – the ECB was in its view responding appropriately. The ECB had hinted at possible interest rate increases over the summer by citing recent growth in the money supply (around 6 per cent on an annual basis). For now, though, the ECB focused on devising a neutral setting for monetary policy. With rising price pressures in some sectors (energy in particular), solid economic growth in Germany, Italy and France, and the ongoing concerns over the weakened euro, the ECB was intent on setting a more stable course for its second year of operation.

The ECB moves toward year two (January–May 2000)

Reflecting on one year of activity, Duisenberg was proud of the ECB's accomplishments. In a revealing interview in the *Observer*, Duisenberg stated that the ECB had delivered on its mandate – that is to provide 'price stability'. In that respect, he was correct. Inflation on an annual basis (for 1999) within the Euro-Zone had hovered at the 2 per cent target. Duisenberg also admitted the difficulty in developing a one policy fits all for the Euro-Zone. But he suggested that the euro had brought increased dynamism to the European economies and helped revive the sluggish economic growth rates of France and Germany. In regard to the previous year's exchange rate controversies, Duisenberg was clear. He stated:

> I always find it a bit unfair to say that the euro has fallen by 12 to 14 percent. What you do then is compare the current rate of the euro with the exchange rate that emerged on one day … . It is more relevant to compare the rate over the last three months with the very stable rate of between 1.08 and 1.10 (against the dollar) that existed prior to the birth of the euro in 1997 and 1998. Depreciation vis-à-vis that rate: that is relevant, and there is no denying it.[126]

Furthermore, Duisenberg elaborated on the question of the ECB's accountability. That issue, Duisenberg contended, has 'more to do with emotion than rationality. It (the ECB) is accountable to the public at large, and that comes through various channels: the European Parliament, the Council of Ministers, to the public directly through interviews like this and speeches'. From the ECB's perspective, then, all was well.

While the ECB had delivered on price stability (keeping the annual rate of inflation at or lower than 2 per cent), the euro had also been

sold to the public as a stable currency – solid on price stability, but also its external value. Certainly, the weak euro was based on the continued credibility problems of national governments in restraining fiscal budgets. And, interest rate differentials and the business cycle in the US compounded euro problems as capital continued to pour into the US, financing record trade deficits and current account deficits. But the ECB's credibility had suffered noticeably due to the confusion in the public and the markets over the ECB's two-pillar strategy and the mixed messages coming from ECB board members and Euro-Zone finance ministers. These problems would in fact worsen in the months ahead.

In successive steps in February and March of 2000, the ECB raised interest rates from 3 to 3.5 per cent in response to the weakening euro, rising oil prices, and strengthening European economic growth that was contributing to the core inflation rate. Many analysts argued that the ECB's interest rate policy was effective but that it sometimes reacted slowly to changing economic and monetary conditions and that its policy pronouncements and communications were still not focused on a coherent long-term strategy for monetary policy and exchange rate management. For example, throughout January of 2000, the ECB had been suggesting that no further movements on interest rates would soon be forthcoming. Yet, as noted, it acted quickly in February to lower rates. Part of the confusion stemmed from the mixed signals of the two-pillar strategy.[127] It was not clear which pillar was emphasized more at any given point in time. What was the ECB's strategy if each pillar pointed in a different direction? Under what conditions would the ECB emphasize one pillar over another? Perhaps it was asking too much of the ECB to reveal publicly its own internal policy struggle, but it had in part set itself up for these kinds of debates.

Driven by political and market pressure, the euro had lost 20 per cent of its value by the end of April, hovering around .92 to the dollar. A further increase in interest rates in late April, from 3.5 to 3.75 per cent, did nothing to halt the slide. Parity with the dollar – which once seemed to represent an unthinkable decline in the euro's value – now looked to many market analysts as an impossibly high target. The chorus of supporters for intervention were increasing.[128] As noted, the primary culprit of the euro's weakness was the spectacular economic growth in the US as well as doubt about the willingness of the governments of the Euro-Zone to enact a number of structural reforms and tax cuts. But more problematic was the question of the credibility of ECB officials and Euro-Zone finance ministers. The euro's habit had

been to undermine every single pronouncement in support of the euro. As the German Finance minister Hans Eichel declared, 'There is strong economic growth and all the economies of the Euro-Zone are better than before the introduction of the common European currency 15 months ago. I calmly say and agree with the president of the ECB and other finance ministers that eventually the markets will also realise this'.[129] But neither the markets nor the public 'realised' this. The euro would continue to weaken throughout the spring.

Partly in response to the lack of a united voice on the euro, in May 2000, a proposal by the Belgium finance minister Didier Reynders was put forth to have the Euro-IX group (soon to be known simply as the 'Eurogroup') participate once a month in the Governing Council of the ECB. The proposal was based on the fact that a normal exchange of information and ideas between national central banks and finance ministers already existed at the national level. Why not make that a normal part of ECB policy-making? Reynders was clear that his proposal was in no way designed to limit the independence of the ECB. In similar spirit, the Eurogroup produced its first-ever joint statement in support of the struggling euro. But the statement received only minor interest from the markets. Having heard repeated and mixed signals from finance ministers – whether singly or collectively – it did not seem to matter. Informal proposals were also floated among ministers, one of which emphasized the creation of a 'Mr. Euro' to speak on behalf of the euro externally and to curtail the mixed voices and signals and messages of finance ministers (see Chapter 3 for more details). While all of these ideas were interesting and in part discussed, they were never seriously considered by national governments or the ECB.

The most dramatic manifestation of the problems besetting the euro and the ECB came in a statement issued in early May by the ECB. The statement was addressed – rather unusually – to 'European citizens' rather than national governments or the financial markets. In many ways, Duisenberg's statement seemed particularly aimed at the Germans. He stated that the weak euro would 'undermine the perception of the euro as a stable currency'. Duisenberg argued that 'European citizens can be assured that the future of the euro is that of a strong currency, based on price stability and the strength of the European economy'. But the euro's weakness was more than just a perception to the Germans and many Europeans; it was a reality as the euro dropped to new record lows of 88.45 cents following Duisenberg's statement. Up to that point, there was nothing in the record of the

ECB's pronouncements to fully support Duisenberg's point of view. Perhaps it was more of a problem of Duisenberg's credibility, rather than the ECB itself. But the surprising statement by Duisenberg demonstrated the extent of concern of the ECB about the public's perception of its credibility.

Duisenberg's statement was met with much criticism, even ridicule – especially in Germany. As Peter Bofinger, a leading German economist noted, 'If there were a price for poor marketing, the ECB would have won it'.[130] Bofinger noted that the ECB still lacked the confidence that was required of the single most powerful European institution. Furthermore, the ECB continued to act defensively rather than as an institution fully in command of its field. For those outside the Euro-tower, it was a wonder that the euro had not fallen even further.[131] It was critical for the ECB to have the confidence, which the bank seemed to be on occasion lacking, or else it would continue to undermine its own ability to function. Moreover, the three interest rate increases since November 1999 had done nothing to stem the slide of the euro. And for socialist-led governments within the Euro-Zone, the rate increases were threatening the first real signs of strong economic growth and job creation in years. Fully 18 months into the EMU, one might have assumed that the job of the ECB would have slowly become easier. Instead, the task had become more difficult as the ECB faced an avalanche of pressure – political, public, and market – to do more to support the euro.

The euro-gloom continues (June–December 2000)

On 9 June, the ECB raised interest rates again by a half of a percentage (to 4.25 per cent). At the time, the euro hovered around record lows of .88 to the dollar. In countless interviews at the time, the ECB predicted that the decline in the euro was now coming to an end; the 'turn-around for the euro' was imminent. It was hoped that this latest interest rate increase would make returns more attractive on investments denominated in euros – hence boosting the sagging euro. Moreover, with M3 at 6.5 per cent (at an annual rate) for April – too high given the ECB's target rate of 4.5 per cent – the hike in the interest rate was clearly justified. Inflation was also pushing just above the 2 per cent target. Compounding the problem, in economically booming Finland, annual growth stood at 5.2 per cent with annual inflation over 3 per cent. In the June *Monthly Report,* the ECB warned that further rate increases might be needed in order to offset threats to price stability.

The ECB appeared confident that its policies were appropriate for the Euro-Zone.

But some politicians, especially in Germany, were attacking the ECB for making the citizens of their countries 'poorer'. While not entirely accurate, the perception among the German public (and German tourists outside the Euro-Zone) was that the euro had quickly become the poor cousin to the deutsche mark. Economists continued to attack the ECB's two-pillar strategy. Financial markets dissected every signal and every word from Duisenberg and other EC bankers. As the German *Süddeustche Zeitung* summed up, Mr. Euro (Duisenberg) needed 'strong citizens, strong politicians, and strong words'.[132] But it appeared that he did not have any of these things. By September, the euro had dropped to record lows at .87 to the dollar. Market analysts and traders were further balking at buying the euro after comments by German Chancellor Gerhard Schröder that implied that he was not concerned about the euro's steep decline as it continued to help German exports. Schröder's comments were intended to soothe the concerns of unnerved German citizens who had lost confidence in their new currency. Yet, his statements contradicted everything that the ECB (and Schröder's own Finance Minister Hans Eichel) was doing to bolster the euro verbally. National interests – it seemed – still prevailed when it came to a specific euro exchange rage policy.

The ECB counterattacked by suggesting that the German government was itself to blame for the euro's problems. Germany was on the implied receiving end of the ECB's repeated warnings to Euro-Zone governments on the necessity of fiscal control. With annual wholesale prices pushing at an annual rate of 5.4 per cent in Germany and with tax cuts likely to push the government's budget deficit to slightly over 1.5 per cent of GDP (still considerably below the 3 per cent targets of the Stability and Growth Pact), the German government was seen by some ECB officials as a contributor to the weak euro.[133] Not surprisingly, with the annual rate of inflation in the Euro-Zone peaking at 2.4 per cent in July (driven by rising energy/oil prices), the ECB raised interest rates another quarter point to 4.5 per cent. Some people within the ECB felt that a further increase in interest rates was needed in order to stem the decline of the euro and to send a signal to governments to control spending.[134] While tension between the ECB and the German government did not come close to matching the tension that existed during Lafontaine's short tenure, the underlying conflict demonstrated the ECB's struggle in asserting its priorities on Euro-Zone governments.

At a press conference following an ECB meeting in early September, Duisenberg admitted he did not understand the euro's slide to record lows given underlying 'strong economic fundamentals'. Instead, Duisenberg placed the blame on 'short term phenomenon' in which 'markets have a tendency to overshoot in one direction or the other. That means they will, at some point, reverse their direction, and it's that point for which I'm so anxiously waiting'.[135] What was clear was that the short-term phenomenon Duisenberg identified was the result of the market's perception that the ECB's credibility was being undermined by conflicts with national governments, by misstatements coming from the President himself, and by the lack of coherent ECB strategy for addressing the euro's decline. In other words, the short term euro depreciation had now turned into a long-term evaluation by the markets.

Anxiously waiting, but not trusting the markets to react to economic fundamentals any time soon, on 14 September the ECB responded with its first major interventions in the currency markets in the amount of $2.2 billion. The intervention failed to boost the euro. Most analysts called the intervention a modest or limited step on behalf of the downtrodden euro. Duisenberg claimed that the move was a routine portfolio adjustment and that 'intervening in the market' on behalf of the euro 'was not part of the motive'.[136] At a press conference following the intervention, he stated clearly that the ECB was unhappy with the euro's slide. 'The fact that the euro has continued to depreciate over recent months is not in line with these economic fundamentals. Our concerns on this issue remain serious and we shall monitor developments closely'.[137] But his justification for intervention was not credible to most analysts. Even the European Commission stepped into the fray suggesting that the ECB do more to prop up the euro which now stood at .86 to the dollar. Interest rate increases – six of them since mid-1999 – had not done the trick, interventions in the market (however modest) did not appear to work, and repeated castigation of Euro-Zone governments' spending policies had failed to convince the markets. The problem for the ECB was one of credibility.

The unexpected decision by the US to join market interventions to support the euro on Friday 22 September surprised investors and supported the efforts of the ECB to enhance the credibility of its strategy of supporting the euro. Yet after initial support in the markets, the currency continued its slide back down from .90 to .87 to the dollar. Following the multilateral intervention, the short-lived consensus on supporting the euro was quickly undermined when US Treasury

Secretary Lawrence Summers issued ambivalent statements following the intervention that further US support in the markets might not be forthcoming. More significantly, according to Summers, the US had not changed its view that a strong dollar was in the US interest.[138] His statements undermined any possibility of further co-ordinated interventions in support of the euro. Duisenberg had hoped that further co-ordinated interventions would bring about an orderly reversal in the euro's decline. However, with the US wavering in its support, any further failed interventions would do even greater damage to the euro and to the ECB's credibility.

The situation continued to worsen for Duisenberg and the euro through the early autumn. First, the ECB raised interest rates one more time on 5 October to 4.75 per cent largely, as it argued, to keep inflationary pressures in check, but also to support the euro. The rate increase did not have any effect on the euro's value. At the same time, the move angered some politicians who suggested that the ECB was stifling economic growth. Second, while support for joining EMU and the euro was driven largely by domestic politics, disarray on the euro intervention further damaged the pro-EMU forces in Denmark. In a referendum, the Danes rejected entry into EMU 53 per cent to 47 per cent. Recognizing the problems the ECB confronted, Duisenberg suggested in an interview in *The Times* that the European Central bank would not intervene again soon to strengthen the euro. He had also acknowledged that he had tried and failed to persuade Secretary of the Treasury Summers to soften his calls for a strong dollar – suggesting that US support for further interventions was unlikely in the future. The markets pounced on the news and the euro sank to a record low of .83 to the dollar. Admitting that he had blundered in the interview, Duisenberg vowed to hold his tongue more in the future and conceded that he had slipped. 'I do realise that some of my recent remarks gave rise to critical comments, and certainly they gave rise to a lot of advice. I draw my conclusions and I accept the advice and thus I'm not going to answer any questions related to that recent interview and any questions related to interventions'.[139] But Duisenberg had committed the cardinal sin of all central bankers – talking of intervention when no credible commitment existed.

Perhaps not learning from their earlier mistakes, European central banks intervened unilaterally (without the Americans) in the markets in early November in another failed (and perhaps desperate) attempt to give their ailing currency a needed boost. As one European economist stated, 'They have put their head on the chopping block … They can't

just suddenly stop because then everybody would ask, do these guys have any intervention strategy at all?'[140] But that was exactly the paradox the ECB confronted: should the NCBs intervene and have their head cut off by currency traders or should they not intervene and have the same thing happen? The market seemed determined to keep the euro where it was – despite the interventions. As one currency trader commented, repeated statements by the ECB that 'intervention is an instrument available at any time' lacked any real 'teeth'.[141] At least when it came to an external euro policy, the ECB had severely damaged its credibility.

Partly in response to the euro's problems and ongoing pressure from its critics, at the end of the year, the ECB decided to publish twice-yearly economic forecasts – especially with a focus on economic growth, inflation, and money growth. Duisenberg hoped that the decision would improve the bank's transparency with the markets. He said the bank was 'trying to improve communication'.[142] Even so, Duisenberg tried to downplay the decision by suggesting that the economic forecasts would not offer a long-term guide to interest rate decisions. However, the move was clearly a grudging acceptance of the fact that the ECB needed to improve its public standing and its communication strategy. It would also allow the ECB to argue more effectively its two-pillar strategy. The effectiveness of these forecasts – and its effect on the credibility of the ECB – would have to stand the test of time.

A stabilizing euro? (January–June 2001)

The first months of 2001 would prove at first to be much better for the ECB. While the elimination of further ECB missteps helped, the small boost for the euro was largely the result of forces beyond the ECB's control. With the ECB keeping interest rates stable at 4.75 per cent, with European economies growing, and with the first signs of economic slowdown in the US, economic fundamentals were finally shifting in the euro's favour. Moreover, with the US Federal Reserve sharply and quickly cutting interest rates in January and April, interest rate differentials began to move more favourably in the direction of investments in the euro. Even with the lingering effects of the Turkish monetary and financial crisis of February, the euro had gained in value from its record lows in the early 80 cent range and was now hovering around .93 to the dollar. Considering the past problems with the euro, the ECB saw the euro's appreciation as a sign of success in its long term policies on price stability.

Most analysts predicted that the ECB would lower rates, perhaps 50 basis points, toward the spring months. Prices remained stable, albeit still above the target rate of 2 per cent. Some were even suggesting an immediate cut in order to offset any potential effect of an anticipated slowdown in the US economy. More directly, at the annual meetings of the G-7 and IMF/World Bank in Washington, DC in April, the IMF (and Canada within the G-7) specifically and rather bluntly targeted the ECB for pressure to reduce interest rates. The ECB resisted the pressure given what the bank felt were continued concerns about national inflation rates over the 2 per cent mark in the Euro-Zone. Further confusion of the final draft of a G-7 communiqué – with Duisenberg insisting that a draft statement included understanding of the ECB's position but the statement not appearing in the final draft – added to the rising confusion within the G-7. It still appeared that the ECB and Euro-Zone finance ministers were not all on one level with the non-Euro-Zone members of the G-7.

But the general economic situation remained relatively good in the Euro-Zone, easing any pressures within the G-7. The ECB was instead preoccupied with press reports citing problems in the actual printing of enough euro banknotes for the 1 January 2002 launch. The ECB responded to the rumours by strongly stating that they were totally 'unfounded'. The 'production is on schedule'.[143] But given the ECB's other problems, the bank's handling of the changeover to euro notes and coins would have to be flawless.

In May, the ECB surprised the markets with a cut its key interest rate by a quarter point to 4.5 per cent. The news gave a brief boost to the euro and triggered optimism in the stock markets. Given the intense pressure coming from the IMF and the G-7 meetings and given the fact that the ECB was the last of the major central banks to lower rates, many still had widely anticipated a move. After insisting for months that inflation remained the number one concern for the ECB, the bank may have been reacting to criticism that it was doing to little to shield the Euro-Zone from the impact of economic trouble in the United States. Duisenberg justified the rate cut based on lower inflationary pressure and a fall in consumer credit growth. But Duisenberg and the ECB could not ignore the largely depressing economic numbers coming from the Euro-Zone's signature economy – Germany. Industrial production, orders and jobs data had all signalled a marked downturn for the German economy. Whatever the interpretation and analysis of the rate cut (again indicating the difficulty that analysts were having in understanding the motivations behind ECB policy), the

ECB would increasingly be tested by the more troubling waters of an emerging Euro-Zone economic slowdown.

As in previous years, June proved a difficult month for the ECB. June 2001 would be no exception. By early June the euro had again lost its value in the financial markets and hovered at .85 euro to the dollar. The ECB once again found itself at the centre of the blame surrounding the euro's depreciation.[144] Comments from Duisenberg that appeared to suggest his lack of concern over the recent dip in the euro unleashed more speculation against the euro. In addition, despite the rate cut in May, some analysts feared the ECB was losing its battle against inflation – which hovered close to an annual rate of 3 per cent. To add to the confusion, speculation also emerged on the possible intervention by the ECB on behalf of the euro. Comments by Otmar Issing and Ernst Welteke (the two Germans on the Governing Council) suggested that the value of the euro had again dropped to potentially unacceptable levels. But given the stumbling intervention efforts of the ECB in the fall and winter of 2000, many doubted that the ECB would in fact intervene. With the August recess of the ECB fast approaching and the decision by the ECB to keep interest rates unchanged for 'some time to come' (in the words of Duisenberg), the euro plunged below .84 euro to the dollar. Any gains that had been made either in terms of the euro's value or the ECB's credibility had largely evaporated by July.

Euro-day approaches; Euro-Zone battles heat up (July 2001–February 2002)

Following the summer recess the ECB returned to work facing mounting pressure for some sort of rate cut. With economic indicators all pointing toward a more severe economic slowdown than previously predicted, Euro-Zone governments were itching for further interest rate cuts. Moreover, with the US economy sliding precipitously toward a recession (and with the Federal Reserve actively cutting rates seven times through the summer of 2001), many analysts were predicting a cut at the 30 August meeting. Indeed, the ECB responded with a quarter point cut to 4.25 per cent. According to Duisenberg, the new level of interest rates were 'compatible with the maintenance of price stability', and were driven by the 'duration and depth of the slowdown in the US'.[145] While government officials hoped for further cuts in 2001, many analysts suggested that the ECB would hold off on any further moves so as not to unsettle currency markets prior to the launch of the euro coins on 1 January 2002.

The terrorist attack on the World Trade Center – a centre for international currency and financial markets – on 11 September 2001 changed the world in so many ways. Its impact on the markets was immediate. With US stock exchanges shut down and currency markets interrupted, real concern about a major collapse of the market was widespread. The need for a co-ordinated response on all levels – diplomatic, political and financial – would be required in order to offset the immense psychological damage inflicted upon investors, markets and the general public. Indeed, the ECB and the Federal Reserve responded. On the day the markets reopened in the US (Monday 17 September), the ECB and Fed cut a half a percentage point off interest rates in order to stablize the markets. The ECB stated that cutting interest rates from 4.25 per cent to 3.75 per cent was made 'in concert' with the Fed because of the weak short-term prospects for European economic growth and as a result of the events of 11 September. Specifically, the ECB noted that 'following the terrorist attacks on the US, uncertainty about the US and world economy' had increased.[146] The ECB cut rates from 4.25 per cent to 3.75 per cent. The G-7, which had to cancel its scheduled meeting in Washington, DC for the end of September, issued a strong statement that it would stand ready to take further co-ordinated action if necessary. Currency intervention was also discussed another instrument that could be employed by the G-7 in order to stabilize currency markets.

Did the ECB and other G-7 central banks act in a timely and responsible manner? Most analysts suggest that they indeed acted correctly and wisely. It should be noted that the rate cut came just days after the ECB had indicated it would take no action on interest rates. Clearly the severity of the attack and the realization among all actors involved of the necessity for clear and concerted action fundamentally changed the playing field. The US stock market had plummeted around 5 per cent the day trading resumed on US markets. Much like the necessity of the co-ordinated efforts of G-7 banks following the market collapse of October 1987, this was not the time to hide behind arguments of inflation targets or indicators of M3. The ECB and other G-7 central banks reacted swiftly and decisively and should be credited with staving off even further panic. Moreover, given the market's rebound in the months that followed, the central bankers were doing their part to advance the interests of the industrialized world.

The 11 September attack and the ECB rate cut of 17 September marked a clear modification in the bank's policies and strategies. The emphasis of the bank's policies would shift away, albeit slightly, from its overriding preoccupation with inflation and growth of monetary

aggregates and toward the need to revive the lagging European economy. Indeed, based on past ECB practice, indicators of annual inflation and M3 (which were still above the ECB's respective targets for both) should have suggested no further room for interest rate cuts. And with the ECB holding firm on no additional rate cuts through the rest of September and through mid-October, the prediction held largely true. But intense pressure from EU governments on the ECB to cut rates further increased. Other central banks, most notably in the US and the UK, had continued to cut rates. In addition, the US economy was now clearly in recession, a recession that would soon erode any hope for stronger economic growth in Europe. Yet Duisenberg defended the ECB's inaction by arguing that it was 'doubtful whether a range of rate changes coming quickly one after the other by themselves … would enhance confidence rather than maybe even undermine confidence', in the ECB.[147]

At an EU summit of heads of states in Belgium the debate over whether the ECB would cut rates further came to a head as German Chancellor Gerhard Schroeder suggested that the ECB could be 'more reasonable' when it came to the bank's interest rate policy. Schroeder was quick to emphasize that he respected the ECB's independence and that the bank's policies had been – until then – quite reasonable. But facing a stagnating German economy, with unemployment pushing up over 4 million, and a parliamentary election slated for September 2002, the chancellor was anxious to see more action taken by the ECB. Moreover, a preliminary draft of an EU summit statement had called for the ECB to take 'further decisive action' in easing monetary policy in order to boost the Euro-Zone's economy.[148] The statement was eventually watered down after objections were raised among ECB officials and some Euro-Zone finance ministers. But face-to-face meetings between EU leaders and the ECB indicated the level to which the disagreement on interest rate policy had risen. With the decision to keep rates steady on 25 October, the political cacophony calling for an immediate rate cut was nearly overwhelming.

Relief came two weeks later as the ECB lowered rates another half percentage point from 3.75 per cent to 3.25 per cent. The fourth rate cut of the year by the ECB was certainly welcome and more decisive than many had anticipated. The ECB justified the cut in terms of falling Euro-Zone inflation rates (still hovering around 2.4 per cent on an annual basis) and mounting evidence of economic disintegration in many Euro-Zone states and the United States. But did the ECB bow to political pressure? The answer is difficult to assess. From the ECB's

perspective, the ECB did not bow to pressure. Its decision to lower rates was consistent with its medium- to long-term perspective on keeping inflation rates and monetary growth under control. Moreover, the decision by the ECB to consider adjusting interest rates only once a month so as to lower speculation in the markets and reduce volatility was also indicative of the ECB's authority over the monetary policy decision-making process. The bank would make its decisions based on its own time table.

But the ECB's move was a clear sign that it had to do something to stabilize public and political sentiment which had risen to a feverish pitch in the two months following the 11 September attack. In fact, the ECB's move could be interpreted as a new approach toward interest rate policy – an attitude more in tune with public and political attitudes. Given the imminent launch of euro notes and coins, the ECB was extremely sensitive to the public's level of acceptance of the changeover. Removing the spotlight away from the ECB's monetary policies and shifting the focus on 1 January 2002 would be seen as an important public relation's strategy for the successful implementation of the changeover. In addition, and fortunately from the ECB's perspective, focus had shifted away from its interest rate policy and toward the deteriorating financial situation in Germany, among other EU countries.

Following a very unsettled three months, the ECB and the EU could now focus on the full and final changeover to euro notes and coins. Concerns about counterfeiting and the supply of coins and notes preoccupied ECB officials (to say nothing of EU governments, banks, and businesses). With great fanfare and with some uncertainty, the launch of the euro was made on 1 January 2002. Long lines at cash machines and some crowding at banks marked the transition. But within days, transactions were preceding smoothly (outside of Italy) as most businesses and consumers were shifting to the euro. Despite some griping about price gouging, the euro launch was a success – boosting the euro's value to over .9 to the dollar. 'E' day had finally arrived and with it, the ECB was now more firmly in control of monetary policy than ever before.

Despite the relatively smooth transition of 'E' day, the European Central Bank and Euro-Zone members would quickly become immersed in serious debates over the future of enhanced economic co-ordination. By February 2002, Germany's budget deficit as a percent of GDP had risen from 1.3 per cent in 2000 to 2.7 per cent in 2001. As outlined in the Stability and Growth Pact, the European Commission

had been given the responsibility to give early warnings to Euro-Zone members who were in danger of breaching the deficit ceilings. With Germany and Portugal both pushing to the upper limits of the deficit ceilings, Chancellor Schröder lobbied vigorously to prevent a vote within ECOFIN to accept a Commission's recommendation of a politically embarrassing formal warning of Germany. Ultimately, ECOFIN agreed unanimously not to issue the warning. In return, the German government promised to monitor national and state government budget figures and spending on social benefits more closely. Germany also promised to balance its budget by 2004. Similar promises on controlling government spending were made by Portugal. What was missing from the equation was the informal Eurogroup. Their role was largely inconsequential in the debates and indicated that ECOFIN remained, outside of the ECB, *primer inter pares* among EU-level institutions of economic governance.

The repercussions from the agreement were enormous; the differing interpretations of the agreement enlightening. German Finance Minister Hans Eichel suggested that the agreement not to issue a formal reprimand of Germany had actually 'strengthened the European Stability and Growth Pact'.[149] Eichel laid much of the blame on the heavily indebted German Land governments and not on the Schröder government. Trying to save some face, Commissioner Solbes suggested that the credibility of the Pact remained undamaged by the agreement – a suggestion not shared by most ECB analysts. Most German economists and industry and bank associations strongly condemned the agreement and its failure to protect the euro's credibility, suggesting the deal was characterized by 'political horse trading'.[150] Duisenberg issued a statement in support of the agreement, but grumbling could be heard throughout the halls of the eurotower and the Bundesbank in Frankfurt. Belgium's Finance Minister Didier Reynders contended that the agreement and ECOFIN had actually 'disciplined' the Germans for the first time – a suggestion accepted by neither the Germans nor the ECB.

The ability of Germany to withstand the Commissioner's pressure seemed to reflect the fact that great power politics remained alive and well within the Euro-Zone. Germany received political backing from the United Kingdom and France. Gordon Brown, the British Finance Minister, suggested that the European Commission had an overly narrow interpretation of the stability pact. Instead, Brown suggested a broader view – supported by the French – of the stability pact that took greater account of economic cycles, investment needs, and the

sustainability of a country's debt. EU Commissioner of Economic and Monetary Affairs Pedro Solbes discounted the British interpretation but found himself on the losing end of some high level of intergovernmental politics. Germany's ability to produce a face-saving formula indicated the overall weakness of economic governance at the EU level. While a number of 'surveillance' mechanisms existed and with the ECB focused on combatting inflation, there was clearly no effective enforcement mechanism on Euro-Zone governments. Even though the ECB did put out constant reminders to the Euro-Zone governments to reign in spending, the credibility of the pact and the effect on the credibility of the euro would likely be long lasting. With the ECB's control over monetary policy now more sharply in focus following E-day, the lack of centralized economic co-ordination and governance clearly in evidence after the heated political debates of early February 2002 would provide a fertile ground for Euro-Zone battles to come.

The likelihood of future Euro-Zone battles over budget deficits and economic governance will be complicated by the announcement of Duisenberg that he would be stepping down as President of the ECB on 9 July 2003. The announcement brought an end to speculation as to when he would step down but renewed speculation over the likely successor. The 1998 débâcle over Duisenberg's initial selection as President of the ECB and the 'gentlemen's agreement' made on the length of tenure in office insured that renewed political infighting would soon return. Duisenberg had hoped that his early decision to retire would strengthen the ECB's credibility by allowing for an orderly succession. But he declined to endorse Jean-Claude Trichet, the likely French candidate for the presidency (Trichet was currently enmeshed in various investigations by the French magistrates). While the decision to step down in July 2003 gives the impression of political independence from French pressure to resign earlier, the politics that will inevitably surround the selection process will renew debate over the personal independence of the ECB. It would be wise to settle the issue of succession quietly without bumping into the deadline set by Duisenberg.

The debate over Duisenberg's succession opened up the door for speculation that other potential candidates were jockeying for position – including the ECB's Vice-President Christian Noyer (whose four-year term expired on 31 May, 2002) and the leading German insider on the ECB Governing Council Otmar Issing. In the months leading to April, debate resurfaced on the future of the position of ECB Vice-President. The highly qualified Greek Lucas Papademos was eventually selected by all member states except the Belgians who had

insisted on the appointment of the noted monetary expert and Belgian Senator Daniel Gros. The Belgians abstained on the final vote and made it clear that they would seek to block the appointment of a Frenchmen as ECB President in 2003 (likely to be Jean-Claude Trichet) if the next appointment to the Executive Board was not a Belgian. Once again, the debate revealed a certain level of embarrassment regarding appointments to the board; more importantly, the appointment débâcle demonstrated the extent to which one member state will still go to push national prerogatives (and potentially undermine ECB independence and credibility).

Through the summer and early fall of 2002, the euro stabilized and even gathered strength as the US economy continued to slump and the ECB's interest rate policies found some footing. The euro even resurfaced to find parity with the dollar, although the euro would again slowly depreciate into the early autumn months – largely on the back of the continuing conflict over Euro-Zone member budget deficits (see below). For its part, the ECB maintained its Euro-Zone rate freeze. Interest rates remained unchanged at 3.25 per cent for the eleventh month in a row. In September the ECB cited general uncertainty over the strength of the limited economic recovery underway in the Euro-Zone and the fact that price stability had become more 'balanced' – precluding any immediate move up or down in rates. Despite the ECB's steady policies, the newly re-elected SPD/Green coalition government in Germany sought to increase pressure on the ECB to reduce rates. Shortly after the September election, the German government urged the ECB to adopt a more growth-oriented monetary policy. Memories of Lafontaine's failed 1999 attempt to pressure the ECB to cut rates should have been clear in Schröder's mind, but the government's limited room for manoeuvre in fiscal policy indicated that the government had to use whatever means necessary – including battling the ECB – to boost employment, growth and tax revenues. It was a battle that the German government would likely lose.

More problematic for the Germans – in addition to many other Euro-Zone member states – was the ongoing problem of budget deficits. In France, Jean-Claude Trichet targeted sharp criticism at the new centre-right government of Jean-Pierre Raffarin for not being more ambitious in its efforts to cut its budget. Specifically, Trichet called for the government to cuts its structural deficit by .5 per cent and to balance the budget by 2006 – both of which the government had so far rejected. During the 2002 French presidential campaign, President Chirac questioned the necessity of respecting the 2004 balanced budget target. In

the lead up to the parliamentary elections, members of conservative Interim government questioned the need to respect the Stability Pact targets 'to the letter'. At the 21–22 June 2002 European summit in Seville, the French were permitted by their European partners to not balance their budget by 2004, except if France enjoyed 3 per cent economic growth or more over the 2002–3 period, an unlikelihood. They would try for 2006 instead. More importantly, on 8 October, Francis Mer, the new French finance minister, was outvoted 11–1 by the other Euro-Zone finance ministers after refusing to honour commitments to cut France's budget deficit. It was likely that the French would face the possibility of a formal rebuke from the EU Commission and increased demands to amend its immediate 2003 budget. Raffarin found himself trapped between the government's commitments to the Stability and Growth Pact on the one hand, and President Chirac's elections promises to cut taxes and increase defence spending – a sure recipe for budget imbalances.

The French debate was the latest in a series of increasingly difficult crises over the Stability and Growth Pact. The most intense crisis to date took place in mid-October when Germany admitted that it would breach the EU rules on deficits. In a television interview, Eichel stated that it would not be possible for Germany to 'stay under the 3 per cent deficit limit'.[151] What is noteworthy was that Eichel was trying to avoid earlier embarrassment during the election campaign by insisting that Germany's budget deficit would only rise to 2.9 per cent of GDP. Speculation in the German press prior to the September election that the finance minister was concealing accurate deficit figures in order to avoid any negative publicity for the campaign seemed to be accurate. The tactic may have worked as the SPD/Green coalition won a narrow victory, largely on the back of the success of the Greens. However, many German economists and bankers complained that the government's policies were only further damaging the euro's value at home and abroad.

Whatever the accuracy of the reports, the credibility of the Stability and Growth Pact and, by definition, the ECB's euro policies, would be severely damaged by the continued inability of Euro-Zone governments (in particular, Portugal, Italy, France and Germany) to curtail deficits. This view was strengthened by Commissioner Solbes' own comments indicating that he was prepared to be patient with countries that on the surface appeared to be willing to take tough measures to control deficits. While there was some indication that the Commission would launch a formal early warning to reprimand France and perhaps launch an

official 'excessive deficit procedure' against Germany, Portugal's 4.1 per cent deficit indicated the problematic nature of the 3 per cent cut-off. It appeared that the Commission was taking the position of more 'flexibility' in the enforcement of the Pact – a move originally feared by conservative German governments and the Bundesbank in the 1990s. While Schröder has insisted that the Pact was untouchable, the battle lines were being drawn for a major fight over interpretation, enforcement and possible amendments to the Pact. The situation was compounded by the remarks of Commission President Prodi who suggested in a 17 October interview in *Le Monde* that the stability pact was 'imperfect' and 'stupid' and that adjusting the pact – albeit a move that required unanimity – was possible. While Prodi's comments were subsequently downplayed by the Commission, it did reflect a prevailing view among centre-left governments and policy-makers.

The ECB was vehemently against any revisions and demanded the strict interpretation and enforcement of the Pact. From day one (July 1998), the ECB had warned governments to maintain fiscal restraint and to avoid fiddling with government ledgers. Any slippage would undermine the ECB's stability-oriented policies and would further damage the euro's credibility both with the public and with the markets. Moreover, the lessons from February, when Germany avoided a formal rebuke for its deficit policies, were now being copied in France, Portugal and Italy. The historic summer floods that overwhelmed much of central Europe were now metaphorically threatening to overwhelm the Stability and Growth damn – and no amount of 'plugging' the financial leaks by Euro-Zone member governments would satisfy the ECB. Would the damn hold? Would the ECB wield its interest rate weapon? Or would the damn need serious reconstruction?

Conclusion

As noted earlier, credibility must be measured over time and must be evaluated in terms of the monetary policies of the bank. In addition, credibility must be earned. Given the relative infancy of the ECB and its record over the last four years, the conclusions drawn from this chapter must be read with some note of caution. In terms of fighting inflation, ensuring price stability, and keeping monetary growth under control and given the ECB's high level of independence (as noted in Chapter 5), it is not surprising then to argue that the ECB's anti-inflation credentials are as strong as ever. When the ECB proclaims its intent to combat inflation, it has established a credible record of

achievement. No one doubts its commitment. The bank has also become – albeit haltingly – more open and transparent with its publishing of forecasts. Finally, with the successful changeover to euro notes and coins on 1 January 2002, the ECB can stand proudly in its position as defender of the euro.

More broadly speaking, however, the euro's depreciation over the last three years, the difficulty in communicating an overarching strategy for the euro, and the ongoing public misquotes by the ECB (and national governments) have damaged the public standing of the ECB and the euro project. Contrary to the statements of Otmar Issing in the introductory quote, the ECB did in fact exacerbate some of the euro uncertainty, especially among a fundamentally critical general public and market. Certainly, Duisenberg has been more careful in his public statements. As Duisenberg himself has noted, '[w]e are making quite an effort to sing with one voice, because the song we are singing is the same. But it sometimes takes us some time to sing in harmony' (Fairlamb, 1999: 64). Admittedly, many economists predicted the continuing decline of the euro – given interest rate differentials between the US and Europe, strong economic growth in general in the US and the inevitable shakiness of ECB policy as it tried to establish its footing in a markedly 'new world' of European monetary politics. But the ECB still needs to earn more credibility if the EMU project is going to succeed and expand through enlargement. 'The ECB faces … a "communication challenge". … There is certainly room for improvement in communicating the ECB's policy decisions and measures'.[152]

The concluding chapter highlights the immediate and long-term challenges confronting the ECB a stagnant Euro-Zone economy and the potential enlargement of the EU. More generally, we analyse the implications of our study on for European integration and the power of the ECB in relation to other EU institutions. Our concern is focused on the changing nature of EU economic governance – primarily over whether to further strengthen efforts at fiscal policy co-ordination – and the role of the ECB within this governance. Given 2002's ongoing crises over budget deficits and the difficulty of enforcing the Stability and Growth Pact, attention will increasingly focus on the need for either some revisions in the Pact or strengthened macroeconomic co-ordination either through the Eurogroup or through other existing or newly-created EU institutions.

7
Conclusion: the ECB and the Future of Europe

> … the unification of Europe has been, and continues to be, a 'work in progress'. The introduction of the euro and the establishment of the European Central Bank form an intrinsic part of this constant evolution. In fact, the dynamics inherent in Economic and Monetary Union suggest that the euro might become a powerful catalyst for further integration. Our job at the ECB is to contribute to making the euro a lasting success. In this way the euro will bring benefits to an enlarged EU and beyond.
>
> Wim Duisenberg, President of the ECB[153]

Introduction

The primary objective of this book was to provide a theoretically and historically rich study of the institutional structure and operation of the ECB. In doing so, we have highlighted the historical transformation toward EMU, the institutional set-up of the ECB, and the bank's independence. We have also evaluated the monetary interests and preferences of key EU member states – Germany, France and the United Kingdom – toward EMU and the ECB. Finally, we briefly analysed the short history of ECB policy-making with a focus on the overarching credibility of the ECB.

Our findings confirm that the ECB has emerged as one of the most powerful actors in European politics. It is well on its way to establishing its influential position within the institutional framework of EU governance – along with the Council of Ministers, the European Commission, the European Parliament, and the member states. While the bank has had problems in establishing its credibility in terms of an

overarching communication strategy for the euro, it has also lived up to its mandate to ensure price stability. Also noteworthy in the ECB's early history is the relative success of the transition to the euro on 1 January 1999 and the ECB's ability to increase its capacity to analyse Euro-Zone data and maintain its Euro-Zone perspective given national variations in economic conditions. It also has emerged dominant in several clashes over its independence – most notably with Oskar Lafontaine in early 1999, but also in resisting pressure from the IMF and some members of the G-7 to lower interest rates in April of 2001. It also has adjusted to the enlargement of the Euro-Zone brought about by Greece's participation in the euro as of 1 January 2001. We concur with Duisenberg's note above and suggest that the ECB has become an integral actor in the larger framework of EU governance and will prove to be a powerful lever for further EU integration.

But the ECB also has been humbled on multiple fronts. The ECB, much like independent national central banks finds itself constrained – by the public, by member states, and by the markets, both within the Euro-Zone and global economy. In its relations with the US, the ECB has been left standing on commitments to exchange rate intervention. Despite unquestioned political independence, the ECB finds its policy autonomy shackled by market pressures that have relentlessly hounded the euro. Moreover, the ECB's image with the general public has been battered by the weak euro. Finally, Denmark's rejection of the euro, the continued foot-dragging by the British (and a likely rejection of the euro in any referendum), the consistent public unease in Germany over the euro project indicate the ongoing legitimacy crisis facing the ECB and the EMU project. The ECB will need to continue to wage an effective public relations campaign to convince all Europeans of the full merits of monetary union.

To be sure, the ECB takes its role as monetary sovereign seriously. And the record demonstrates the ECB operating in a world of monetary disorder, setting hedges that guide economic policy-makers within the Euro-Zone. In addition, there are those that criticize the ECB as being out of touch with the needs of the economies of the Euro-Zone and with the needs of the people. In other words, the ECB has shifted power toward the centre (the ECB) and away from the freedoms of individual states to regulate monetary policy. The notion of the unaccountable, undemocratic, secretive ECB still permeates monetary discussion among European politicians and the public.

Nonetheless, European monetary policy is not made in a vacuum – the creation of a monetary monster is far from reality. As noted above,

the ECB is not omnipotent, its power not absolute. Indeed, the power of the ECB might thus be compared loosely with that of Thomas Hobbes' Leviathan as revealed through a more careful reading of the original texts: a supreme ruler that is nonetheless greatly constrained in its actions by natural law and constitutional structures. First, EU institutions have a limited say on aspects of European monetary policy and the ECB must use other institutions to forward its own policy goals. Second, a degree of loose co-ordination has been established (and is gradually being reinforced) between the ESCB and fiscal and macroeconomic policy-making authorities at the EU and national levels in order to achieve an appropriate policy mix and the kind of structural reforms that will ensure the maintenance of price stability in the medium to long term. Related, and more problematic, has been the weakening of the Stability and Growth Pact that makes ECB policy-making even more challenging and difficult. The ECB has most of the responsibility for managing the single currency. However, it can only make an economic success of the euro – and thus maintain public support for it – within the context of tight co-ordination with other EU institutions and national governments. In this way, the ECB has and must continue to balance the interests of the public, member states, and the markets with the ECB's inherent urge to control and order. In particular, the ability to control and order has been offset by national governments and respective national central bank governors articulating visions of the euro that have been at cross-purposes with the ECB Executive Board. While the ECB has tried to 'sing in harmony', the bank's chorus still needs some fine-tuning. Given the existing institutional structure within the ECB and in its relations with other EU- and national-level institutions, the bank will be hard pressed to reign in the discordant notes coming from the chorus.

The ECB is the first to recognize its limits; it would argue that while it does have firm control over the monetary levers of the Euro-Zone, there are multiple competing actors with control over various other macroeconomic levers that make any comparison of the more absolutist image of Hobbes' Leviathan meaningless. The first years of ECB policy have demonstrated the difficulty the bank has had with competing centres of power – from the national governments, the national central banks, the public, the markets, and the institutions of the EU. While the social contract that is the Maastricht Treaty and the Stability and Growth Pact continue to insure – at least for the moment – a good measure of discipline and order, *they are no guarantee* that individual Euro-Zone members will never again pursue self-interest or national

objectives counter to the goals and objectives of the ECB. While the larger outlines of the 'social contract' are all but agreed upon by most players, the ongoing differing interpretations of the internal operation and workings of the Euro-Zone suggest a much more fluid political arena within which the ECB is but one player – albeit an important and powerful one.

It is in this still quite fluid political and institutional scenario that the book has identified a number of critical issues and challenges confronting the ECB in the near future. Certainly there are a number of short-term challenges confronting the ECB – especially the ongoing struggles with Euro-Zone data collection and weakening government fiscal balances. However, in this concluding chapter we analyse how significant longer-term challenges within the Euro-Zone will shape the future operation of the EMU and the ECB more profoundly. In particular we focus on the institutional challenges of economic governance, the impact of enlargement, and the ongoing issues of policy credibility and the euro.

Institutional challenges and the ECB

On 1 January 1999, the ECB became one of the most powerful EU institutions affecting the lives of all people living in the member states of the Euro-Zone. It is without doubt the most independent European institution, both from other EU bodies as well as national governments. As such, the transfer of European monetary policy to the ECB highlights the problematic legitimacy of the EU as a political system. The European Central Bank will have to manage with considerable technical skill and political sensitivity its role in monetary policy-making and the 'hard' and 'soft' co-ordination of fiscal and macroeconomic policies with other EU institutions and national governments. Efforts to strengthen the democratic legitimacy of European monetary policy-making have focused less on the role and powers of the ECB – given the desire to preserve the bank's independence and credibility – and more on the reinforcement of the co-ordination role and profile of the ECB's political interlocutor in the Eurogroup. It remains to be seen if the European Central Bank can cope with (and if European governments can manage) the political fall out created by economic recession and uneven internal shocks in the Euro-Zone without the support of a more interventionist 'economic government' at the EU level (McKay 1999a, 1999b, 2000).

The institutional challenges confronting the ECB are therefore quite enormous. Despite the apparent solid foundation of institutional inde-

pendence and political support from member governments, the ECB has become a focal point for concern about the lack of direct accountability and transparency in its policy-making process and institutional structure. Modifications in the current institutional structure of the ECB are likely needed. Furthermore, the lack of clarity over exchange rate policy (see more below), the lack of a centralized EU budgetary or political authority, and the looming enlargement of possibly five new members into the EU in the next five years will put further pressure on the institutional weaknesses of current EU monetary policy-making processes and institutions.

The ongoing problems with accountability, transparency, and 'democratic deficits' that plague the EU's credibility in the eyes of the people will focus intently on the ECB. While the EU already regulates the European public in many policy arenas across Europe, the ECB has had and will continue to have the most direct and profound impact on all Europeans. The ECB has and will continue to face the searing heat of the political spotlight like no central bank has ever faced before. Will the ECB melt under such pressure? If the ECB is able to withstand such pressure, what EU institution will become the focal point for the public's demand for accountability? The Eurogroup has not been of any real significance, at least initially. Neither the European Commission nor the European Parliament will likely fulfill this role – at least not in the near term.

From the earlier discussion on the merits of central bank independence, accountability in an open, democratic society is an important element of an effectively functioning political system. In Germany, at least the government served this function. If the ECB and the EU institutions fail in this function, the future of EMU and the EU may very well rest on shaky political foundations. Both the German government and the Bundesbank recognized this fact when they pushed for European political union to operate in conjunction with EMU. The Bundesbank explicitly noted the importance of political union prior to Maastricht. Specifically, the Bundesbank argued that '… a Monetary Union is … an irrevocable sworn cofraternity – "all for one and one for all" – which, if it is to prove durable, requires, judging from past experience, even closer links in the form of a comprehensive political union'.[154] Judging from the past experiences of German monetary politics, it will prove critical for the EU to develop political union – a strengthened EP and revised Council – in order to reassure the public and provide a stable political foundation for the future operation of the EMU. Ultimately, political institutions must provide a vehicle in

which the people of Europe can express their concerns, worries, fears, hopes and anger.

One way of dealing with the democratic deficit is to think in terms of principal agent theory. In an innovative analysis, Elgie (2001) applies principal–agent theory (see Calvert, McCubbins and Weingast 1989 and Pollack 1997) – which can be classified as an application of rational choice institutionalism – to understand better the nature of the democratic deficit created by the ECB's control over European monetary policy. He also applies the theory to demonstrate ways to diminish the deficit in the event that this is deemed to be unacceptable. Elgie argues that the theory illustrates that both ECB critics and supporters have 'intrinsically sound positions'. First, the theory demonstrates that the agent (the ECB) is 'shirking' from the delegation of power as set up by the principal (the member states collectively) in the TEU and, thus acting in an undemocratic manner. It can be argued that the ECB has insufficiently taken into consideration its secondary objective to support the general economic policies in the Community and promote 'balanced and sustainable economic growth and social progress, and strengthening economic and social cohesion'. The TEU does state that price stability is the 'primary' responsibility of the Bank. However, the lack of a precise definition of this goal worried many observers that the Bank would become overly zealous in maintaining low inflation thus menacing deflation.[155] By largely ignoring its secondary goal the Bank could be accused of shirking and acting in an undemocratic manner.

A second way in which the principal–agent theory can be applied to explain the underlying logic of criticism of the ECB is that the preferences of the principal have changed since the Maastricht Summit resulting in a divergence with the preferences of the ECB. This is demonstrated principally in the French government's efforts to establish an 'economic government', a political counterweight to check the ECB. The institutional and political difficulties of amending the terms of delegation effectively prevents the synchronization of the principal's and agent's preferences. Elgie argues that principal–agent theory can be used by ECB critics 'to imply that whatever the initial preferences of the principal may have been the ECB is now acting in an undemocratic manner'. It could be argued that this use of the principal–agent theory is problematic in that only a part of the principal has changed its preferences. The perception of democratic deficit is thus likely to be stronger in some EU countries and in particular constituencies than in others. The problem here lies with the principal itself – not the agent

per se – which, if in agreement on this matter could seek to modify the treaty (however institutionally problematic). Principal–agent theory can also be used to justify arguments presented by those who support the ECB against accusations of democratic deficit. The argument is made that 'the ECB has been faithful to the clearly expressed preferences of the principal at the moment of delegation': central bank autonomy and price stability, regarding which the Bank was allowed 'to decide for itself exactly what was meant' (Elgie 2001).

Principal–agent theory also proposes standard and non-standard solutions to the principal–agent problem (the risk of growing divergence between the preferences of the principal and the agent) including ex ante and ex post controls, police-patrol, fire alarm oversight and sanctions. The aim here is to enable other institutions to survey the agent's (ECB's) shirking and to discourage further shirking. Ex ante controls, including a renegotiation of the terms of the delegation, sanctions and fire alarms are all considered too potentially damaging to the ECB's credibility and thus unlikely to be introduced. Elgie argues that there are several possible ways for increasing the police-patrol oversight without treaty reform and in ways that weaken neither the statutory responsibility nor the credibility of the ECB, including the commissioning of scientific studies and the holding of hearings to question officials. Indeed, the EP has already begun to play an important role in this regard. Duisenberg agreed that he or an Executive Board member would appear before the EP's Economic and Monetary Affairs Committee four times per year. Elgie also points to Duisenberg's statements and ECB reports to show that there is 'some evidence that the EP has managed to encourage the Bank to pay greater attention to its secondary objective regarding growth and employment'. The ECB shows some willingness to accept publicly that there is a floor to its definition of price stability to prevent deflation. An example of this is found in the Bank's annual report for 1998 in which it is noted that 'deflation, i.e., prolonged decline in the level of the HICP index, would also not be deemed consistent with price stability' (ECB 1999, p. 49). Furthermore, Duisenberg justified the Bank's decision to cut interest rates on 8 April 1999 on similar grounds, stating that 'price stability and social stability are not conflicting, but supplementary and mutually reinforcing policy objectives. As economic policy-makers, we should keep this in mind when we formulate strategies to promote employment and social stability' (Duisenberg 1999, p. 3). Elgie argues that the European Parliament can do a lot more on its own accord to demonstrate publicly its own preoccupations concerning the conduct

of monetary policy, including the more frequent organisation of EP debates, even in the absence of ECB officials, and the passing of resolutions on ECB affairs.

Elgie also presents non-standard solutions to the principal–agent problem. The Eurogroup is statutorily forbidden from seeking to influence ECB members (and to pressurize the ECB in any formal sense). However, this does not prevent it from establishing 'a more discrete and subtle dialogue with the ECB' with the aim of creating a 'favourable and mutually respectful environment with which the [Bank] may be encouraged to give greater importance to popular sentiment when making its decisions'. Elgie gives the example of the ECB's first cut in interest rates in April 1999, which could be interpreted as demonstrating the Bank's political sensitivities – meeting halfway the widespread political demands for an interest rate cut – while also rewarding EU governments for the departure of the trouble maker, Lafontaine.

Closely related, the prestige of the euro among the public will depend on how effective the EMU can deal with various crises – from external shocks from dollar instability, internal shocks within certain regions, and the ongoing political question of high unemployment in some parts of the Euro-Zone. The ability to deal with crises that are certain to come will depend on the institutional and legal foundations of EMU. Will the Stability Pact operate as designed? Will there be a political forum to address or counter ECB policy? Will political union develop? Will the ECB in fact be able to withstand pressure on exchange rate policy and how will such policy be developed? How will the ECB integrate new members – whether the three remaining EU members not part of EMU or the possible new members from the east (see more below)? All of these issues demand further clarity of EU institutions – clarity that can only come through institutional modification.

For the ECB itself, the future of the ECB's independence and credibility will depend on the ability of EMU to function effectively in the post-2002 period. Most national central bank officials believe that in order to ensure a frictionless transition from national currencies to the euro, it is especially important that the euro and EMU enjoy the same prestige on international financial markets as that attained by the DM over the past decades. The early record – the euro's depreciation against the dollar by over 20 per cent – is not quite so convincing. More problematic is the institutional relationship between the ECB and Eurogroup over exchange rate policy. As noted earlier, states

sought to retain control over exchange rate policy and constrain the supranational competence of the ECB in this arena. With the increasing complexity and integration of the global economy, a single external voice on exchange rate policy would appear to be crucial. While the ECB thinks it is the 'voice' on exchange rate policy,[156] we would contend that this 'voice', is still lacking, thus damaging the euro's and EMU's successful implementation as well as the EU's external monetary influence. Therefore, in order for EMU to function effectively, exchange rate policy-making must be more clearly articulated from one institutional body – not left unclear in the institutional grey-area between the ECB, the Eurogroup, and ECOFIN.

Finally, the legitimacy problem has placed increased focus on the matters of accountability and transparency. Monetary policy decisions will affect member states differently due to different national economic cycles (despite some convergence) and differently structured economies. Given the lack of financial transfer payments to compensate those parts of the Euro-Zone suffering from asymmetrical shocks, limited labour mobility and the strong constraints placed on the use of national fiscal instruments, the ECB's response to these shocks will be of considerable importance. The risk remains strong that some member states may come to feel disadvantaged by ECB monetary policy, that the legitimacy of the bank will then be called into question, and the pressure will increase on governments to speak out. Doubts about the ECB's legitimacy increase the need for Executive Board members to give frequent interviews, press conferences and speeches about goals and instruments. NCB governors need to do the same at the national level. Likewise, the decision to hold two Governing Council meetings a year in other Member States was designed to improve the visibility of the ECB. The ECB must also be careful in its public criticism of member state economic policies, leaving this to the Commission and the Eurogroup – as in February 2001 with regard to Ireland. More generally, the maintenance of an effective and positive working relationship with the Eurogroup is vital to the ECB's public image.

In fact, the ECB recognizes these problems and suggests the need for a political body at the EU level that it can engage in a dialogue over the future direction of the Euro-Zone. Many – including within the ECB – call for strengthened links between the ECB and the EP to improve the democratic legitimacy/accountability of the ECB. Favero *et al.* (2000) argue that the European Parliament should have a greater say over the appointment of the members of the Executive Board *and* the weight of the Board versus NCB governors could be increased

(see also Taylor (2000)). However, this is inherently problematic given that the EP, despite being directly elected, is neither well understood nor well liked by many Europeans. Moreover, the strong opposition of several Euro-Zone member state governments to increased EP involvement in European monetary affairs makes this unlikely. This is concern that increased EP meddling would damage the appearance of independence and the credibility of ECB monetary policy. Other observers, led by the French government, argue that the democratic legitimacy problem can be partially resolved by creating a stronger and more visible political counterweight to the independent ECB – the European equivalent of the American Treasury Secretary (Boyer 2000). This could come through the reinforcement of the Eurogroup – a priority of the French Council Presidency in 2000 – through, for example, the eventual creation of a high profile permanent representative to help manage economic policy co-ordination and act as the ECB's leading political interlocutor (Howarth 2001).

All of these issues center around the possible need for improved EU-level economic governance. While there is no consensus between national governments on the larger design of such a model of EU economic governance, we suggest the need for a more effective way to conduct policies through a collective European institution (or set of institutions). This institution (or set of institutions) would need to reflect the desires of European citizens and have a stabilization function while leaving the implementation of suggested policies to national governments. This new institutional set-up would need to fill the existing policy gap between the ECB, ECOFIN, the Eurogroup, and the Commission. Currently, economic and political decisions made by these institutions often are not integrated into the national policies of Euro-Zone states and are clearly not yet grounded in public support. This especially evident given the latest crises over the Stability and Growth Pact. In times of economic slowdown and growing pressures on budgets, are governments and publics absolutely committed to ECB independence and the 3 per cent deficit cut-off all in the spirit of supporting the euro? Increased democratic cooperation will be necessary in order to implement common macroeconomic policies and fiscal policies. Neither the Nice Summit of 2000 nor proposals for a new form of EU governance advanced by the Germans in April of 2001 to make the EU more democratic are likely to substantially address the need for more collective economic governance. While a long-term challenge for the EU in general, the short-term complications of the lack of economic governance will greatly constrain the ECB in the next year or two.

Enlargement and the future of the ECB

Neither the 1996/97 Amsterdam Treaty nor the 2000 IGC (Nice Summit) focused much attention on the impact of enlargement upon the operation of the ECB and the Euro-Zone. The lack of urgency is in part due to the two-step process by which the applicant countries will join the Euro-Zone. While they must respect the convergence criteria and make the necessary institutional preparations to accede to the EU, they will initially join the Single Market and the ERM II and only accede to the Euro-Zone at a later stage. The European Commission has argued that candidate countries should take their time based on the fact that existing EU law requires at least a two-year gap after a country joins the EU before it can enter the monetary union. The Commission also interprets the Maastricht criteria to include the mandate that candidate countries maintain national currencies stable against the euro. Moreover, the Commission suggests that candidate countries not rush into EMU in that such attempts 'could be highly damaging'.[157] In that respect, the Commission's concerns are echoed by the ECB which sees the need for candidate countries to retain a measure of monetary autonomy and flexibility given the transitioning of those economies toward a market oriented system.

Nonetheless, the impact of enlargement looms large principally because it highlights existing problems with the operation of the Governing Council. As a result, we would contend that the question of enlargement and its impact on ECB decision-making will likely be the most divisive issue confronting the ECB and national governments in the next 5–10 years as some or all of the new EU member states enter the Euro-Zone. As it stands now, many observers question if the Eurosystem's structure – notably a Governing Council of 18 – is conducive to efficient or optimal policy-making or policy co-ordination especially when the matters discussed are technical (Favero *et al.*, 2000). Any enlargement poses considerable problems. Willem Buiter, a member of the Monetary Policy Committee of the Bank of England, writes:

> A group of 17 is already too large for the serious and productive exchange of views, discussion and group decision making. … A squad of 21 will be quite unwieldy. Thirty would be a mob. … Based on my own limited experience, a policy-making body with seven members would probably be optimal (1999: 200).

The Governing Council can change its own practices if it finds problems in decision making. There is much scope for its procedures to evolve – such as the creation of more working groups – and the work of the Governing Council can involve more activity at the ECB or through the NCBs. However, the size problem still does matter.

Favero *et al*. (2000) amongst others suggest that the problem could be resolved by emulating the American Federal Reserve Board, by increasing the power of the Executive Board in relation to the NCB governors and rotating Governing Council places among the member states. However, such a recommendation ignores both the unique character of both the Eurosystem as a 'federal' banking system and the EU as a political entity. First, the centre (the ECB) is considerably less dominant in the Eurosystem than in the American system. The NCBs retain considerably more power than American state banks and the governors have final say – thanks to their majority in the Governing Council – over the allocation of functions. Any reform to strengthen the Executive Board at the expense of the Governing Council would be challenged on grounds of legitimacy. The arrangements of the American Federal Reserve Board were developed just over 60 years ago, around 160 years after the creation of the United States as a country and long after the conclusion of the Civil War successfully asserted federal government authority. There is obviously no parallel situation in the EU.

Buiter (1999) recommends – even without enlargement – restricting the size of the Governing Council to nine members and the Executive Board to four. However, it could be argued that the EU lacks the legitimacy as a political system to deny member states a permanent seat on the ECB Governing Council. No other EU institution currently denies member states representation. It is unlikely that the existing members or their governments will be willing to remove the right to a permanent seat. Officially, each NCB Governor is there in a personal capacity as an experienced expert on central banking not as a national representative *per se*. In theory, therefore, a rotation of governors (either all or only the less populated member states) would be adequate: a particular group of them should be as representative of informed opinion as all of them. However, the Governors are de facto national representatives because they each come from one of the member states and are most familiar with their own national systems. It would be difficult for Governors to present the perspective of other member states as effectively as their own, making a simple rotation of seats for all or even just the smaller member states problematic. One possibility might be

to group the smaller member states together so that they share one seat on the Governing Council, or three member states (for example, the Netherlands, Belgium and Luxembourg) could share two seats. The governors would be required to maintain close links with the governors and central banks of their partner states. The decision at the Nice Summit to move to the future rotation of Commission places – yet to be devised but 'based on the principle of equality' and reflecting demography and geography – once the number of EU member states reaches 27 sets a precedent which might be followed for the ECB Governing Council.

Lastly, there is the issue of timing. Candidate countries could adopt the euro unilaterally – as Estonia threatened to do in 2002. Estonia in particular is in a good position already given its peg of the kroon to the D-mark since 1992. In that sense, Estonia is already fixed into the euro system. However, Estonia would likely not receive support from the ECB in times of monetary or financial difficulty. And the ECB does not (and cannot) take these candidate countries' economic conditions into account. Still, high-level policy dialogue between the ECB and central bank governors from the accession countries is ongoing and intense. Professional working relationships have developed and the ECB offers continuing technical assistance to the possible new members. In this respect, a foundation has been created for the accession countries to align their policies to the euro and seek ECB assistance, where appropriate.

However, it should be clear that the ECB tends to be very cautious about enlargement – reflecting the Bundesbank's own views on candidate countries to EMU back in the late 1980s and 1990s. Our own interviews with ECB officials confirm the general unease with this topic. The ECB sees the eastern European countries as largely still out of convergence with the Euro-Zone in terms of inflation rates, growth rates, budget deficits and debt. These states still need to transition and converge on the Euro-Zone (again, Slovenia and Estonia might be closer than other candidate countries). The ECB suggests a more realistic approach for future member states and sees the euro's role as easing the economic divisions of Europe – but only over the very long-term. Finally, given the existing problems of differential growth rates and inflation rates within the Euro-Zone (and the difficulties in data collection), one would suspect even deeper problems in terms of developing EU level co-ordination and cooperation. To be blunt, the ECB would prefer to see this issue not dealt with any time soon.

Conclusion: credibility and creating a 'vision' for the euro

All of these issues – from concerns about the legitimacy and transparency of the ECB and its policies to the institutional weakness of the EU and the ECB in terms of co-ordinating EU macroeconomic governance and decision-making in the Governing Board – have weighed heavily on the ECB's credibility and the value of the euro. This has been painfully evident with the euro's depreciation – one critical measure of the bank's credibility in the eyes of the public and the markets. The ECB's inability to articulate an effective or convincing overarching vision on the euro and the bank's policies has proven the achilles heel of ECB monetary governance. Chapter 6 demonstrated the particular acute problems of the ECB in this arena. One might suspect that any further bending of the rules on the convergence criteria for accession countries or increased 'flexibility' in enforcing or interpreting the Stability and Growth Pack might put increased downward pressure on the euro.

In short, a credibility gap has emerged in the minds of many Europeans. The gap exists between the expectations of a strong euro upon which the EMU was sold to Europeans (especially the Germans and French) and the reality of the euro's value. The ECB would counter the notion of a credibility gap by stating its view that the euro's value is driven by factors beyond its control: strong economic growth in the US and weak economic growth in Europe, structural problems in several Euro-Zone member state economies and the failure of several governments to make the kinds of reforms that would enable sustainably low public deficits. Moreover, the ECB would argue that it has fulfilled its strict mandate of maintaining price stability despite brief bursts of inflation over the past two years. While the ECB's vision may seem too narrow to some – HICP inflation in the euro area at or below 2 per cent – few seem to question this vision any more. The ECB has done its job (for now), but what is still lacking is this larger vision for the ECB and the euro. Perhaps demanding a new vision for the euro may be asking too much of the ECB, although the notion of the ECB acting as in important agent of integration and economic success – as noted by Duisenberg in the introductory quote – is a step in the right direction.

The future of the ECB provides a rich ground for academics and policy-makers to test their theories and their practical policy recommendations. We hope that we have contributed to this debate and that we have provided a strong foundation for future analysis.

Appendix 1

Protocol on the Statute of the European System of Central Banks and of the European Central Bank

THE HIGH CONTRACTING PARTIES
DESIRING to lay down the Statute of the European System of Central Banks and of the European Central Bank provided for in Article 4a of the Treaty establishing the European Community,
HAVE AGREED UPON the following provisions, which shall be annexed to the Treaty establishing the European Community:

CHAPTER 1

CONSTITUTION OF THE ESCB

ARTICLE 1

The European System of Central Banks

1.1. The European System of Central Banks (ESCB) and the European Central Bank (ECB) shall be established in accordance with Article 4a of this Treaty; they perform their tasks and carry on their activities in accordance with the provision of this Treaty and of this Statute.

1.2. In accordance with Article 106(1) of the Treaty, the ESCB shall be composed of the ECB and of the central banks of the member states ('national central banks'). The Institut monétaire luxembourgeois will be the central bank of Luxembourg.

CHAPTER II

OBJECTIVES AND TASKS OF THE ESCB

ARTICLE 2

Objectives

In accordance with Article 105(1) of this Treaty, the primary objective of the ESCB shall be to maintain price stability. Without prejudice to the objective of price stability, it shall support the general economic policies in the Community with a view to contributing to the achievement of the objectives of the Community as laid down in Article 2 of this Treaty. The ESCB shall act in accordance with the principle of an open market economy with free competition, favouring an efficient allocation of resources, and in compliance with the principles set out in Article 3a of the Treaty.

ARTICLE 3

Tasks

3.1. In accordance with Article 105(2) of this Treaty, the basic tasks to be carried out through the ESCB shall be:
- to define and implement the monetary policy of the Community
- to conduct foreign exchange operations consistent with the provisions of Article 109 of this Treaty;
- to hold and manage the official foreign reserves of the member states;
- to promote the smooth operation of payment systems.

3.2. In accordance with Article 105(3) of this Treaty, the third indent of Article 3.1 shall be without prejudice to the holding and management by the governments of Member States of foreign exchange working balances.

3.3. In accordance with Article 105(5) of this Treaty, the ESCB shall contribute to the smooth conduct of policies pursued by the competent authorities relating to the prudential supervision of credit institutions and the stability of the financial system.

ARTICLE 4

Advisory functions

In accordance with Article 105(4) of this Treaty:

(a) the ECB shall be consulted:
- on any proposed Community act in its fields of competence;
- by national authorities regarding any draft legislative provision in its fields of competence, but within the limits and under the conditions set out by the Council in accordance with the procedure laid down in Article 42;

(b) the ECB may submit opinions to the appropriate Community institutions or bodies or to national authorities on matters in its fields of competence.

ARTICLE 5

Collection of statistical information

5.1. In order to undertake the tasks of the ESCB, the ECB, assisted by the national central banks, shall collect the necessary statistical information either from the competent national authorities or directly from economic agents. For these purposes it shall cooperate with the Community institutions or bodies and with the competent authorities of the member states or third countries and with international organizations.

5.2. The national central banks shall carry out, to the extent possible, the tasks described in Article 5.1.

5.3. The ECB shall contribute to the harmonization, where necessary, of the rules and practices governing the collection, compilation and distribution of statistics in the areas within its fields of competence.

5.4. The Council, in accordance with the procedure laid down in Articles 42, shall define the natural and legal persons subject to reporting requirements, the confidentiality regime and the appropriate provisions for enforcement.

ARTICLE 6

International co-operation

6.1. In the field of international co-operation involving the tasks entrusted to the ESCB, the ECB shall decide how the ESCB shall be represented.

6.2. The ECB and, subject to its approval, the national central banks may participate in international monetary institutions.

6.3. Articles 6.1 and 6.2 shall be without prejudice to Article 109(4) of this Treaty.

CHAPTER III

ORGANIZATION OF THE ESCB

ARTICLE 7

Independence

In accordance with Article 107 of this Treaty, when exercising the powers and carrying out the tasks and duties conferred upon them by this Treaty and this Statute, neither the ECB, nor a national central bank, nor any member of their decision-making bodies shall seek or take instructions from Community institutions or bodies, from any government of a member state or from any other

body. The Community institutions and bodies and the governments of the member states undertake to respect this principle and not to seek to influence the members of the decision-making bodies of the ECB or of the national central banks in the performance of their tasks.

ARTICLE 8

General principle

The ESCB shall be governed by the decision-making bodies of the ECB.

ARTICLE 9

The European Central Bank

9.1. The ECB which, in accordance with Article 106(2) of this Treaty, shall have legal personality, shall enjoy in each of the member states the most extensive legal capacity accorded to legal persons under its law; it may, in particular, acquire or dispose of movable and immovable property and may be a party to legal proceedings.

9.2. The ECB shall ensure that the tasks conferred upon the ESCB under Article 105(2), (3) and (5) of this Treaty are implemented either by its own activities pursuant to this Statute or through the national central banks pursuant to Articles 122.1 and 14.

9.3. In accordance with Article 106(3) of this Treaty, the decision-makingg bodies of the ECB shall be the Governing Council and the Executive Board.

ARTICLE 10

The Governing Council

10.1. In accordance with Article 109a(1) of the Treaty, the Governing Council shall comprise the members of the Executive Board of the ECB and the Governors of the national central banks.

10.2. Subject to Article 10.3, only members of the Governing Council present in person shall have the right to vote. By way of derogation from this rule, the Rules of Procedure referred to in Article 12.3 may lay down that members of the Governing Council may cast their vote by means of teleconferencing. These rules shall also provide that a member of the Governing Council who is prevented from voting for a prolonged period may appoint an alternate as a member of the Governing Council.

Subject to Articles 10.3 and 11.3, each member of the Governing Council shall have one vote. Save as otherwise provided for in this Statute, the Governing Council shall act by a simple majority. In the event of a tie, the President shall have the casting vote.

In order for the Governing Council to vote, there shall be a quorum of two-thirds of the members. If the quorum is not met, the President

may convene an extraordinary meeting at which decisions may be taken without regard to the quorum.

10.3. For any decisions to be taken under Articles 28, 29, 30, 32, 33 and 51, the votes in the Governing Council shall be weighted according to the national central banks' shares in the subscribed capital of the ECB. The weights of the votes of the members of the Executive Board shall be zero. A decision requiring a qualified majority shall be adopted if the votes cast in favour represent at least two-thirds of the subscribed capital of the ECB and represent at least half of the shareholders. If a Governor is unable to be present, he may nominate an alternate to cast his weighted vote.

10.4. The proceedings of the meetings shall be confidential. The Governing Council may decide to make the outcome of its deliberations public.

10.5. The Governing Council shall meet at least ten times a year.

ARTICLE 11

11.1. In accordance with Article 109a(2)(a) of this Treaty, the Executive Board shall comprise the President, the Vice-President and four other members.

The members shall perform their duties on a full-time basis. No member shall engage in any occupation, whether gainful or not, unless exemption is exceptionally granted by the Governing Council.

11.2. In accordance with Article 109a(2)(a) of this Treaty, the President, the Vice-President and the other Members of the Executive Board shall be appointed from among persons of recognized standing and professional experience in monetary or banking matters by common accord of the governments of the member states at the level of the Heads of State or of Government, on a recommendation from the Council after it has consulted the European Parliament and the Governing Council.

Their term of office shall be 8 years and shall not be renewable.

Only nationals of member states may be members of the Executive Board.

11.3. The terms and conditions of employment of the members of the Executive Board, in particular their salaries, pensions and other social security benefits shall be the subject of contracts with the ECB and shall be fixed by the Governing Council on a proposal from a Committee compromising three members appointed by the Governing Council and three members appointed by the Council. The members of the Executive Board shall not have the right to vote on matters referred to in this paragraph.

11.4. If a member of the Executive Board no longer fulfils the conditions required for the performance of his duties or if he has been guilty of serious misconduct, the Court of Justice may, on application by the Governing Council or the Executive Boards, compulsorily retire him.

11.5. Each member of the Executive Board present in person shall have the right to vote and shall have, for that purpose, one vote. Save as otherwise provided, the Executive Board shall act by a simple majority of the votes cast. In the event of a tie, the President shall have the casting vote. The voting arrangements shall be specified in the Rules of Procedure referred to in Article 12.3.

11.6. The Executive Board shall be responsible for the current business of the ECB.
11.7. Any vacancy on the Executive Board shall be filled by the appointment of a new member in accordance with Article 11.2.

ARTICLE 12

Responsibilities of the decision-making bodies

12.1. The Governing Council shall adopt the guidelines and take the decisions necessary to ensure the performance of the tasks entrusted to the ESCB under this Treaty and this Statute. The Governing Council shall formulate the monetary policy of the Community including, as appropriate, decisions relating to intermediate monetary objectives, key interest rates and the supply of reserves in the ESCB, and shall establish the necessary guidelines for their implementation.

The Executive Board shall implement monetary policy in accordance with the guidelines and decisions laid down by the Governing Council. In doing so the Executive Board shall give the necessary instructions to national central banks. In addition the Executive Board may have certain powers delegated to it where the Governing Council so decides.

To the extent deemed possible and appropriate and without prejudice to the provisions of this Article, the ECB shall have recourse to the national central banks to carry out operations which form part of the tasks of the ESCB.

12.2. The Executive Board shall have responsibility for the preparation of meetings of the Governing Council.
12.3. The Governing Council shall adopt Rules of Procedure which determine the internal organization of the ECB and its decision-making bodies.
12.4. The Governing Council shall exercise the advisory functions referred to in Article 4.
12.5. The Governing Council shall take the decisions referred to in Article 6.

ARTICLE 13

The President

13.1. The President or, in his absence, the Vice-President shall chair the Governing Council and the Executive Board of the ECB.
13.2. Without prejudice to Article 39, the President or his nominee shall represent the ECB externally.

ARTICLE 14

National central banks

14.1. In accordance with Article 108 of this Treaty, each member state shall ensure, at the latest at the date of the establishment of the ESCB, that its

national legislation, including the statutes of its national central bank, is compatible with this Treaty and this Statute.

14.2. The statutes of the national central banks shall, in particular, provide that the term of office of a Governor of a national central bank shall be no less than 5 years.

A Governor may be relieved from office only if he no longer fulfils the conditions required for the performance of his duties or if he has been guilty of serious misconduct. A decision to this effect may be referred to the Court of Justice by the Governor concerned or the Governor Council on grounds of infringement of this Treaty or of any rule of law relating to its application. Such proceedings shall be instituted within two months of the publication of the decision or of its notification to the plaintiff or, in the absence thereof, of the day on which it came to the knowledge of the latter, as the case may be.

14.3. The national central banks are an integral part of the ESCB and shall act in accordance with guidelines and instructions of the ECB. The Governing Council shall take the necessary steps to ensure compliance with the guidelines and instructions of the ECB, and shall require that any necessary information be given to it.

14.4. National central banks may perform functions other than those specified in this Statute unless the Governing Council finds, by a majority of two-thirds of the votes cast, that these interfere with the objectives and tasks of the ESCB. Such functions shall be performed on the responsibility and liability of national central banks and shall not be regarded as being part of the functions of the ESCB.

ARTICLE 15

Reporting commitments

15.1. The ECB shall draw up and publish reports on the activities of the ESCB at least quarterly.

15.2. A consolidated financial statement of the ESCB shall be published each week.

15.3. In accordance with Article 109b(3) of this Treaty, the ECB shall address an annual report on the activities of the ESCB and on the monetary policy of both the previous and the current year to the European Parliament, the Council and the Commission, and also to the European Council.

15.4. The reports and statements referred to in this Article shall be made available to interested parties free of charge.

ARTICLE 16

Bank Notes

In accordance with Article 105a(1) of this Treaty, the Governing Council shall have the exclusive right to authorize the issue of bank notes within the

Community. The ECB and the national central banks may issue such notes. The bank notes issued by the ECB and the national central banks shall be the only such notes to have the status of legal tender within the Community.

The ECB shall respect as far as possible existing practices regarding the issue and design of bank notes.

CHAPTER IV

MONETARY FUNCTIONS AND OPERATIONS OF THE ESCB

ARTICLE 17

Accounts with the ECB and the national central banks

In order to conduct their operations, the ECB and the national central banks may open accounts for credit institutions, public entities and other market participants and accept assets, including book-entry securities, as collateral.

ARTICLE 18

Open market and credit operations

18.1. In order to achieve the objectives of the ESCB and to carry out its tasks, the ECB and the national central banks may:
- operate in the financial markets by buying and selling outright (spot and forward) or under repurchase agreement and by lending or borrowing claims and marketable instruments, whether in Community or in non-Community currencies, as well as precious metals;
- conduct credit operations with credit institutions and other market participants, with lending being based on adequate collateral.

18.2. The ECB shall establish general principles for open market and credit operations carried out by itself or the national central banks, including for the announcement of conditions under which they stand ready to enter into such transactions.

ARTICLE 19

Minimum reserves

19.1. Subject to Article 2, the ECB may require credit institutions established in Member States to hold minimum reserves on accounts with the ECB and national central banks in pursuance of monetary policy objectives. Regulations concerning the calculation and determination

of the required minimum reserves may be established by the Governing Council. In cases of non-compliance the ECB shall be entitled to levy penalty interest and to impose other sanctions with comparable effect.

19.2. For the application of the Article, the Council shall, in accordance with the procedure laid down in Article 42, define the basis for minimum reserves and the maximum permissible ratios between those reserves and their basis, as well as the appropriate sanctions in cases of non-compliance.

ARTICLE 20

Other instruments of monetary control

The Governing Council may, by a majority of two-thirds of the votes cast, decide upon the use of such other operational methods of monetary control as its sees its, respecting Article 2.

The Council shall, in accordance with the procedure laid down in Article 42, define the scope of such methods if they impose obligations on third parties.

ARTICLE 21

Operations with public entities

21.1. In accordance with Article 104 of this Treaty, overdrafts or any other type of credit facility with the ECB or with the national central banks in favour of the Community institutions or bodies, central governments, regional, local or other public authorities, other bodies governed by public law, or public undertakings of member states shall be prohibited, as shall the purchase directly from them by the ECB or national central banks of debt instruments.

21.2. The ECB and national central banks may act as fiscal agents for the entities referred to in Article 21.1.

21.3. The provisions of this Article shall not apply to publicly-owned credit institutions which, in the context of the supply of reserves by central banks, shall be given the same treatment by national central banks and the ECB as private credit institutions.

ARTICLE 22

Clearing and payment systems

The ECB and national central banks may provide facilities, and the ECB may make regulations, to ensure efficient and sound clearing and payment systems within the Community and with other countries.

ARTICLE 23

External operations

The ECB and national central banks may:
- establish relations with central banks and financial institutions in other countries and, where appropriate, with international organizations;
- acquire and sell spot and forward all types of foreign exchange assets and precious metals; the term 'foreign exchange asset' shall include securities and all other assets in the currency of any country or units of account and in whatever for held;
- hold and manage the assets referred to in the Article;
- conduct all types of banking transactions in relations with third countries and international organizations, including borrowing and lending operations.

ARTICLE 24

Other operations

In addition to operations arising from their tasks, the ECB and national central banks may enter into operations for their administrative purposes or for their staff.

CHAPTER V

PRUDENTIAL SUPERVISION

ARTICLE 25

Prudential supervision

25.1. The ECB may offer advice to and be consulted by the Council, the Commission and the competent authorities of the member states on the scope and implementation of Community legislation relating to the prudential supervision of credit institutions and to the stability of the financial system.

25.2. In accordance with any decision of the Council under Article 105(6) of this Treaty, the ECB may perform specific tasks concerning policies relating to the prudential supervision of credit institutions and other financial institutions with the exception of insurance undertakings.

CHAPTER VI

FINANCIAL PROVISIONS OF THE ESCB

ARTICLE 26

Financial accounts

26.1. The financial year of the ECB and national central banks shall begin on the first day of January and end on the last day of December.

26.2. The annual accounts of the ECB shall be drawn up by the Executive Board, in accordance with the principles established by the Governing Council. The accounts shall be approved by the Governing Council and shall thereafter be published.

26.3. For analytical and operation purposes, the Executive Board shall draw up a consolidated balance sheet of the ESCB, comprising those assets and liabilities of the national central banks that fall within the ESCB.

26.4. For the application of this Article, the Governing Council shall establish the necessary rules for standardizing the accounting and reporting of operation undertaken by the national central banks.

ARTICLE 27

Auditing

27.1. The accounts of the ECB and national central banks shall be audited by independent external auditors recommended by the Governing Council and approved by the Council. The auditors shall have full power to examine all books and accounts of the ECB and national central banks and obtain full information about their transactions.

27.2. The provisions of Article 188c of this Treaty shall only apply to an examination of the operation efficiency of the management of the ECB.

ARTICLE 28

Capital of the ECB

28.1. The capital of the ECB, which shall become operational upon its establishment, shall be ECU 5000 million. The capital may be increased by such amounts as may be decided by the Governing Council acting by the qualified majority provided for in Article 10.3, within the limits and under the conditions set by the Council under the procedure laid down in Article 42.

28.2. The national central banks shall be the sole subscribers to and holders of the capital of the ECB. The subscription of capital shall be according to the key established in accordance with Article 29.

28.3. The Governing Council, acting by the qualified majority provided for in Article 10.3, shall determine the extent to which and the form in which the capital shall be paid up.

28.4. Subject to Article 28.5, the shares of the national central banks in the subscribed capital of the ECB may not be transferred, pledged or attached.

28.5. If the key referred to in Article 29 is adjusted, the national central banks shall transfer among themselves capital shares to the extent necessary to ensure that the distribution of capital shares corresponds to the adjusted key. The Governing Council shall determined the terms and conditions of such transfers.

ARTICLE 29

Key for capital subscription

29.1. When in accordance with the procedure referred to in Article 109/(1) of this Treaty the ESCB and the ECB have been established, the key for subscription of the ECB's capital shall be established. Each national central bank shall be assigned a weighting in this key which shall be equal to the sum of:

- 50% of the share of its respective Member State in the population of the Community in the penultimate year preceding the establishment of the ESCB;
- 50% of the share of its respective member state in the gross domestic product at market prices of the Community as recorded in the last five years preceding the penultimate year before the establishment of the ESCB;

The percentages shall be rounded up to the nearest multiple of 0.05 percentage points.

29.2. The statistic data to be used for the application of this Article shall be provided by the Commission in accordance with the rules adopted by the Council under the procedure provided for in Article 42.

29.3. The weightings assigned to the national central banks shall be adjusted every five years after the establishment of the ESCB by analogy with the provisions laid down in Article 29.1. The adjusted key shall apply with effect from the first day of the following year.

29.4. The Governing Council shall take all other measures necessary for the application of this Article.

ARTICLE 30

Transfer of foreign reserve assets to the ECB

30.1. Without prejudice to Article 28, the ECB shall be provided by the national central banks with foreign reserve assets, other than Member States' currencies, ECUs, IMF reserve positions and SDRs, up to an

amount equivalent to ECU 50 000 million. The Governing Council shall decide upon the proportion to be called up by the ECB following its establishment and the amounts called up at later dates. The ECB shall have the full right to hold and manage the foreign reserves that are transferred to it and to use them for the purposes set out in this Statute.

30.2. The contributions of each national central bank shall be fixed in proportion to its share in the subscribed capital of the ECB.

30.3. Each national central bank shall be credited by the ECB with a claim equivalent to its contribution. The Governing Council shall determine the denomination and remuneration of such claims.

30.4. Further calls of foreign reserve assets beyond the limit set in Article 30.1 may be effected by the ECB, in accordance with Article 30.2, within the limits and under the conditions set by the Council in accordance with the procedure laid down in Article 42.

30.5. The ECB may hold and manage IMF reserve positions and SDRs and provide for the pooling of such assets.

30.6. The Governing Council shall take all other measures necessary for the application of this Article.

ARTICLE 31

Foreign reserve assets held by national central banks

31.1. The national central banks shall be allowed to perform transactions in fulfilment of their obligations towards international organizations in accordance with Article 23.

31.2. All other operations in foreign reserve assets remaining with the national central banks after the transfers referred to in Article 30, and member states' transactions with their foreign exchange working balances shall, above a certain limit to be established within the framework of Article 31.3, be subject to approval by the ECB in order to ensure consistency with the exchange rate and monetary policies of the Community.

31.3. The Governing Council shall issue guidelines with a view to facilitating such operations.

ARTICLE 32

Allocation of monetary income of national central banks

32.1. The income accruing to the national central banks in the performance of the ESCB's monetary policy function (hereinafter referred to as 'monetary income') shall be allocated at the end of each financial year in accordance with the provisions of this Article.

32.2. Subject to Article 32.3, the amount of each national central bank's monetary income shall be equal to its annual income derived from its assets

held against notes in circulation and deposit liabilities to credit institutions. These assets shall be earmarked by national central banks in accordance with guidelines to be established by the Governing Council.

32.3. If, after the start of the third stage, the balance sheet structures of the national central banks do not, in the judgement of the Governing Council, permit the application of Article 32.2, the Governing Council, acting by a qualified majority, may decide that, by way of derogation from Article 32.2, monetary income shall be measured according to an alternative method for a period of not more than five years.

32.4. The amount of each national central bank's monetary income shall be reduced by an amount equivalent to any interest paid by that central bank on its deposit liabilities to credit institutions in accordance with Article 19.

The Governing Council may decide that national central banks shall be indemnified against costs incurred in connection with the issue of bank notes or in exceptional circumstances for specific losses arising from monetary policy operations undertaken for the ESCB. Indemnification shall be in a form deemed appropriate in the judgement of the Governing Council; these amounts may be offset against the national central banks' monetary income.

32.5. The sum of the national central banks' income shall be allocated to the national central banks in proportion to their paid-up shares in the capital of the ECB, subject of any decision taken by the Governing Council pursuant to Article 33.2.

32.6. The clearing and settlement of the balances arising from the allocation of monetary income shall be carried out by the ECB in accordance with guidelines established by the Governing Council.

32.7. The Governing Council shall take all other measures necessary for the application of this Article.

ARTICLE 33

Allocation of net profits and losses of the ECB

33.1. The net profit of the ECB shall be transferred in the following order:

(a) an amount to be determined by the Governing Council, which may not exceed 20% of the net profit, shall be transferred to the general reserve fund subject to a limit equal to 100% of the capital;

(b) the remaining net profit shall be distributed to the shareholders of the ECB in proportion to their paid-up shares.

33.2. In the event of a loss incurred by the ECB, the shortfall may be offset against the general reserve fund of the ECB and, if necessary, following a decision by the Governing Council, against the monetary income of the relevant financial year in proportion and up to the amounts allocated to the national central banks in accordance with Article 32.5.

CHAPTER VII

GENERAL PROVISIONS

ARTICLE 34

Legal acts

34.1. In accordance with Article 108a of this Treaty, the ECB shall:
- make regulations to the extent necessary to implement the tasks defined in Article 3.1, first indent, Articles 19.1, 22 or 25.2 and in cases which shall be laid down in the acts of the Council referred to in Article 42;
- take decisions necessary for carrying out the tasks entrusted to the ESCB under this Treaty and this Statute;
- make recommendations and deliver opinions.

34.2. A regulation shall have general application. It shall be binding in its entirety and directly applicable in all member states.

Recommendations and opinions shall have no binding force.

A decision shall be binding in its entirety upon those to whom it is addressed.

Articles 190 to 192 of this Treaty shall apply to regulations and decisions adopted by the ECB.

The ECB may decide to publish its decisions, recommendations and opinions.

34.3. Within the limits and under the conditions adopted by the Council under the procedure laid down in Article 42, the ECB shall be entitled to impose fines or periodic penalty payments on undertakings for failure to comply with obligations under its regulations and decisions.

ARTICLE 35

Judicial control and related matters

35.1. The acts or omissions of the ECB shall be open to review or interpretation by the Court of Justice in the cases and under the conditions laid down in this Treaty. The ECB may institute proceedings in the cases and under the conditions laid down in this Treaty.

35.2. Disputes between the ECB, on the one hand, and its creditors, debtors or any other person, on the other, shall be decided by the competent national courts, save where jurisdiction has been conferred upon the Court of Justice.

35.3. The ECB shall be subject to the liability regime provided for in Article 2l5 of this Treaty. The national central banks shall be liable according to their respective national laws.

35.4. The Court of Justice shall have jurisdiction to give judgement pursuant to any arbitration clause contained in a contract concluded by or on

behalf of the ECB, whether that contract be governed by public or private law.

35.5. A decision of the ECB to bring an action before the Court of Justice shall be taken by the Governing Council.

35.6. The Court of Justice shall have jurisdiction in disputes concerning the fulfilment by a national central bank of obligations under this Statute. If the ECB considers that a national central bank has failed to fulfil an obligation under this Statute, it shall deliver a reasoned opinion on the matter after giving the national central bank concerned the opportunity to submit its observations. If the national central bank concerned does not comply with the opinion within the period laid down by the ECB, the latter may bring the matter before the Court of Justice.

ARTICLE 36

Staff

36.1. The Governing Council, on a proposal from the Executive Board, shall lay down the conditions of employment of the staff of the ECB.

36.2. The Court of Justice shall have jurisdiction in any dispute between the ECB and its servants within the limits and under the conditions laid down in the conditions of employment.

ARTICLE 37

Seat

Before the end of 1992, the decision as to where the seat of the ECB will be established shall be taken be common accord of the governments of the member states at the level of Heads of State or of Government.

ARTICLE 38

Professional secrecy

38.1. Members of the governing bodies and the staff of the ECB and the national central banks shall be required, even after their duties have ceased, not to disclose information of the kind covered by the obligation of professional secrecy.

38.2. Persons having access to data covered by Community legislation imposing an obligation of secrecy shall be subject to such legislation.

ARTICLE 39

Signatories

The ECB shall be legally committed to third parties by the President or by two members of the Executive Board or by the signatures of two members of the

staff of the ECB who have been duly authorized by the President to sign on behalf of the ECB.

ARTICLE 40

Privileges and immunities

The ECB shall enjoy in the territories of the member states such privileges and immunities as are necessary for the performance of its tasks, under the conditions laid down in the Protocol on the Privileges and Immunities of the European Communities annexed to the Treaty establishing a Single Council and a Single Commission of the European Communities.

CHAPTER VIII

AMENDMENT OF THE STATUTE AND COMPLEMENTARY LEGISLATION

ARTICLE 41

Simplified amendment procedure

41.1. In accordance with Article 106(5) of this Treaty, Articles 5.1, 5.2, 5.3, 17, 18, 19.1, 22, 23, 24, 26, 32.2, 32.3, 32.4, 32.6, 33.1(a) and 36 of this Statute may be amended by the Council, acting either by a qualified majority on a recommendation from the ECB and after consulting the Commission, or unanimously on a proposal from the Commission and after consulting the ECB. In either case the assent of the European Parliament shall be required.

41.2. A recommendation made by the ECB under this Article shall require a unanimous decision by the Governing Council.

ARTICLE 42

Complementary legislation

In accordance with Article 106(6) of this Treaty, immediately after the decision on the date for the beginning of the third stage, the Council, acting by a qualified majority either on a proposal from the Commission and after consulting the European Parliament and the ECB or on a recommendation from the ECB and after consultation the European Parliament and the Commission, shall adopt the provisions referred to in Articles 4, 5.4, 19.2, 20, 28.1, 29.2, 30.4 and 34.3 of this Statute.

CHAPTER IX

TRANSITIONAL AND OTHER PROVISIONS FOR THE ESCB

ARTICLE 43

General provisions

43.1. A derogation as referred to in Article 109k(l) of this Treaty shall entail that the following Articles of the Statute shall not confer any rights or impose any obligations on the member state concerned: 3, 6, 9.2, 12.1, 14.3, 16, 18, 19, 20, 22, 23, 26.2, 27, 30, 31, 32, 33, 34, 50, 52.

43.2. The central banks of member states with a derogation as specified in Article 109k(l) of this Treaty shall retain their powers in the field of monetary policy according to national law.

43.3. In accordance with Article 109k(4) of this Treaty, 'member states' shall be read as 'member states without a derogation' in the following Articles of this Statute: 3, 11.2, 19, 34.2 and 50.

43.4. 'National central banks' shall be read as 'central banks of member states without a derogation' in the following Articles of this Statute: 9.2, 10.1, 10.3, 12.1, 16, 17, 18, 22, 23, 27, 30, 31, 32, 33.2, 52.

43.5. 'Shareholders' shall be read as 'central banks of member states without a derogation' in Articles 10.3 and 33.1.

43.6. 'Subscribed capital of the ECB' shall be read as 'capital of the ECB subscribed by the central banks of member states without a derogation' in Articles 10.3 and 30.2.

ARTICLE 44

Transitional tasks of the ECB

The ECB shall take over those tasks of the EMI which, because of the derogations of one or more member states, still have to be performed in the third stage.

The ECB shall give advice in the preparations for the abrogation of the derogations specified in Article 109k of this Treaty.

ARTICLE 45

The General Council of the ECB

45.1. Without prejudice to Article 106(3) of this Treaty, the General Council shall be constituted as a third decision-making body of the ECB.

45.2. The General Council shall comprise the President and Vice-President of the ECB and the Governors of the national central banks. The other

members of the Executive Board may participate, without having the right to vote, in meetings of the General Council.

45.3. The responsibilities of the General Council are listed in full in Article 47 of this Statute.

ARTICLE 46

Rules of procedure of the General Council

46.1. The President or, in his absence, the Vice-President of the ECB shall chair the General Council of the ECB.

46.2. The President of the Council and a member of the Commission may participate, without having the right to vote, in meetings of the General Council.

46.3. The President shall prepare the meetings of the General Council.

46.4. By way of derogation from Article 12.3, the General Council shall adopt its Rules of Procedure.

46.5. The Secretariat of the General Council shall be provided by the ECB.

ARTICLE 47

Responsibilities of the General Council

47.1. The General Council shall:
- perform the tasks referred to in Article 44;
- contribute to the advisory functions referred to in Articles 4 and 25.1.

47.2. The General Council shall contribute to:
- the collection of statistical information as referred to in Article 5;
- the reporting activities of the ECB as referred to in Article 15;
- the establishment of the necessary rules for the application of Article 26 as referred to in Article 26.4;
- the taking of all other measures necessary for the application of Article 29 as referred to in Article 29.4;
- the laying down of the conditions of employment of the staff of the ECB as referred to in Article 36.

47.3. The General Council shall contribute to the necessary preparations for irrevocably fixing the exchange rates of the currencies of member states with a derogation against the currencies, or the single currency, of the member states without a derogation, as referred to in Article 109/(5) of this Treaty.

47.4. The General Council shall be informed by the President of the ECB of decisions of the Governing Council.

ARTICLE 48

Transitional provisions for the capital of the ECB

In accordance with Article 29.1 each national central bank shall be assigned a weighting in the key for subscription of the ECB's capital. By way of derogation

from Article 28.3, central banks of member states with a derogation shall not pay up their subscribed capital unless the General Council, acting by a majority representing at least two-thirds of the subscribed capital of the ECB and at least half of the shareholders, decides that a minimal percentage has to be paid up as a contribution to the operational costs of the ECB.

ARTICLE 49

Deferred payment of capital, reserves and provisions of the ECB

49.1. The central bank of a member state whose derogation has been abrogated shall pay up its subscribed share of the capital of the ECB to the same extent as the central banks of other member states without a derogation, and shall transfer to the ECB foreign reserve assets in accordance with Article 30.1. The sum to be transferred shall be determined by multiplying the ECU value at current exchange rates of the foreign reserve assets which have already been transferred to the ECB in accordance with Article 30.1, by the ratio between the number of shares subscribed by the national central banks concerned and the number of shares already paid up by the other national central banks.

49.2. In addition to the payment to be made in accordance with Article 49.1, the central bank concerned shall contribute to the reserve of the ECB, to those provisions equivalent to reserves, and to the amount still to be appropriated to the reserves and provisions corresponding to the balance of the profit and loss account as at 31 December of the year prior to the abrogation of the derogation. The sum to be contributed shall be determined by multiplying the amount of the reserves, as defined above and as stated in the approved balance sheet of the ECB, by the ratio between the number of the shares subscribed by the central bank concerned and the number shares already paid up by the other central banks.

ARTICLE 50

Initial appointment of the members of the Executive Board

When the Executive Board of the ECB is being established, the President, the Vice-President and the other members of the Executive Board shall be appointed by common accord of the governments of the member states at the level of Heads of State or of Government, on a recommendation from the Council and after consulting the European Parliament and the Council of the EMI. The President of the Executive Board shall be appointed for eight years. By way of derogation from Article 11.2, the Vice-President shall be appointed for four years and the other members of the Executive Board for terms of office of between five and eight years. No term of office shall be renewable. The number of members of the Executive Board may be smaller than provided for in Article 11.1, but in no circumstance shall it be less than four.

ARTICLE 51

Derogation from Article 32

51.1. If, after the start of the third stage, the Governing Council decides that the application of Article 32 results in significant changes in national central banks' relative income positions, the amount of income to be allocated pursuant to Article 32 shall be reduced by a uniform percentage which shall not exceed 60% in the first financial year after the start of the third stage and which shall decrease by at least 12 percentage points in each subsequent financial year.

51.2. Article 51.1 shall be applicable for not more than five financial years after the start of the third stage.

ARTICLE 52

Exchange of bank notes in Community currencies

Following the irrevocable fixing of exchange rates, the Governing Council shall take the necessary measures to ensure that bank notes denominated in currencies with irrevocably fixed exchange rates are exchanged by the national central banks at their respective par values.

ARTICLE 53

Applicability of the transitional provisions

If and as long as there are Member States with a derogation Articles 43 to 48 shall be applicable.

Appendix 2

Resolution of the European Council on the Stability and Growth Pact

I. Meeting in Madrid in December 1995, the European Council confirmed the crucial importance of securing budgetary discipline in stage three of Economic and Monetary Union (EMU). In Florence, six months later, the European Council reiterated this view and in Dublin, in December 1996, it reached an agreement on the main elements of the Stability and Growth pact. In stage three of EMU, member states shall avoid excessive general government deficits: this is a clear Treaty obligation.[†]

The European Council underlines the importance of safeguarding sound government finances as a means to strengthening the conditions for price stability and for strong sustainable growth conducive to employment creation. It is also necessary to ensure that national budgetary policies support stability oriented monetary policies. Adherence to the objective of sound budgetary positions close to balance or in surplus will allow all member states to deal with normal cyclical fluctuations while keeping the government deficit within the 3 percent GDP reference value.

II. Meeting in Dublin in December 1996, the European Council requested the preparation of a Stability and Growth pact to be achieved in accordance with the principles and procedures of the Treaty. This Stability and Growth pact in no way changes the requirements for participation in stage three of EMU, either in the first group or at a later date. Member states remain responsible for their national budgetary policies, subject to the provisions of the Treaty; they will take the necessary measures in order to meet their responsibilities in accordance with those provisions.

III. The Stability and Growth pact, which provides both for prevention and deterrence, consists of this resolution and two Council Regulations, one on the strengthening of the surveillance of budgetary positions and the surveil-

[†] Under Article 5 of Protocol 25, the obligation does not apply to the United Kingdom unless it moves to the third stage; the obligation under Article 116(4) to endeavour to avoid excessive deficits shall continue to apply to the United Kingdom.

lance and coordination of economic policies and another on speeding up and clarifying the implementation of the excessive deficit procedure.

IV. The European Council solemnly invites all parties, namely the member states, the Council and the Commission, to implement the Treaty and the Stability and Growth pact in a strict and timely manner. This resolution provides firm political guidance to the parties who will implement the Stability and Growth Pact. To this end, the European Council has agreed upon the following guidelines:

The Member States

1. commit themselves to respect the medium-term budgetary objective of close to balance or in surplus set out in their stability or convergence programmes and to take the corrective budgetary action they deem necessary to meet the objectives of their stability or convergence programmes, whenever they have information indicating actual or expected significant divergence from those objectives;
2. are invited to make public, on their initiative, the Council recommendations made to them in accordance with article 99(4);
3. commit themselves to take the corrective budgetary action they deem necessary to meet the objectives of their stability or convergence programmes once they receive an early warning in the form of a Council recommendation issued under Article 99(4);
4. will launch the corrective budgetary adjustments they deem necessary without delay on receiving information indicating the risk of an excessive deficit;
5. will correct excessive deficits as quickly as possible after their emergence; this correction should be completed no later than the year following the identification of the excessive deficit, unless there are special circumstances;
6. are invited to make public, on their own initiative, recommendations made in accordance with Article 104(7);
7. commit themselves not to invoke the benefit of Article 2 paragraph 3 of the Council Regulation on speeding up and clarifying the excessive deficit procedure unless they are in severe recession; in evaluating whether the economic downturn is severe, the Member States will, as a rule, take as a reference point an annual fall in real GDP of at least 0.75%.

The Commission

1. will exercise its right of initiative under the Treaty in a manner that facilitates the strict, timely and effective functioning of the Stability and Growth pact;
2. will present, without delay, the necessary reports, opinions and recommendations to enable the adoption of Council decisions under Article 99 and Article 104; this will facilitate the effective functioning of the early warning system and the rapid launch and strict application of the excessive deficit procedure;
3. commits itself to prepare a report under Article 104(3) whenever there is the risk of an excessive deficit or whenever the planned or actual government

deficit exceeds the 3 per cent of GDP reference value, thereby triggering the procedure under Article 104(3).
4. commits itself, in the event that the Commission considers that a deficit exceeding 3% of GDP is not excessive and this opinion differs from that of the Economic and Financial Committee, to present in writing to the Council the reasons for its position;

The Council

1. is committed to a rigorous and timely implementation of all elements of the stability and growth pact in its competence; it will take the necessary decisions under Article 99 and Article 104 as quickly as is practicable;
2. is urged to regard the deadlines for the application of the excessive deficit procedure as upper limits; in particular, the Council, acting under Article 104(7), shall recommend that excessive deficits will be corrected as quickly as possible after their emergence, no later than the year following their identification, unless there are special circumstances;
3. is invited always to impose sanctions if a participating member state fails to take the necessary steps to bring the excessive deficit situation to an end as recommended by the Council;
4. is urged always to require a non-interest bearing deposit, whenever the council decides to impose sanctions on a participating Member State in accordance with Article 104(11);
5. is urged always to convert a deposit into a fine after two years of the decision to impose sanctions in accordance with Article 104(11), unless the excessive deficit has in the view of the Council been corrected;
6. is invited to always state in writing the reasons which justify a decision not to act, if at any stage of the excessive deficit or surveillance of budgetary positions procedures the Council did not act on a Commission recommendation, and, in such a case, to make public the votes cast by each member state.

Notes

1. All notes of Thomas Hobbes' *Leviathan* are from the edition by Michael Oakeshott (Oxford: Basil Blackwell, 1957).
2. This naturally begs the question: Do not individual rights also need to be protected against a government powerful enough to oppress them?
3. Verdun (1996 and 2000c) outlines how the CNPF membership was split on the question of EMU.
4. The 'inconsistent quartet' includes free trade, while the 'triangle' includes only monetary policy autonomy, free capital flows and fixed exchange rates. Following the Maastricht Summit, this 'quartet' was presented as the official technocratic justification in favour of EMU in several EU member states.
5. There are, of course, powerful arguments against the usefulness of neofunctionalism more generally. Despite the detail of its analysis, neofunctionalism's predictions about automatic, gradual and incremental progression into deeper European integration and greater supranational influence have not always been accurate. Community building has come in fits and starts, fraught with sustained periods of 'euro-pessimism' and 'euro-sclerosis'. Spill-over, while occurring in certain sectors or policy-arenas, has not necessarily occurred in any and all other sectors or areas. In fact, some policy areas have strongly resisted spill-over as states have jealously guarded sovereignty. Moreover, the autonomous influence of supranational authorities has increased only slowly and unevenly, if at all.
6. Haas (1990: 55) defines epistemic community as:

   > a professional group that believes in the same cause-and-effect relationship, truth tests to assess theory and shares common values. As well as sharing an acceptance of a common body of facts, its members share a common interpretative framework, or 'consensual knowledge', from which they convert such facts, or observations, to policy-relevant conclusions. … An epistemic community's power resource, domestically and internationally, is its authoritative claim to knowledge. To the extent that its members can penetrate the walls of government and maintain their authority, new orders of behavior are possible.

   He also notes (1992: 3) that:

   > an epistemic community is a network of professionals from a variety of disciplines and backgrounds, they have 1) a shared set of normative and principled beliefs, which provide a value-based rationale for the social action of community members; 2) shared causal beliefs, which are derived from their analysis of practices leading or contributing to a central set of problems in their domain and which then serve as the basis for elucidating the multiple linkages between possible policy actions and desired outcomes; 3) shared notions of validity – that is, intersubjective, internally defined criteria for weighing and validating

knowledge in the domain of their expertise; and 4) a common policy enterprise – that is, a set of common practices associated with a set of problems to which their professional competence is directed, presumably out of the conviction that human welfare will be enhanced as a consequence.

7. With regard to France see Howarth (2001).
8. Central bankers, themselves, have frequently made such claims. See Blessing (1966) and Emminger (1966).
9. The 'garbage can' model corresponds neither to the views of the policy-makers themselves as to their principal motivations nor to any apparent hidden motives. In the French case (Howarth 2001) at no time have policy-makers stated that they sought to share policy-making at the European level because it was excessively controversial to deal with it at home. This approach ignores the very strong republican tradition in France of political control over all elements of policy-making. Moreover, during the three year period prior to the Maastricht Treaty, there were no speculative attacks against the franc, no franc realignments – after January 1987 – and the French economy was performing well, in spite of high interest rates, at least until 1990, long after the solidification of French policy on EMU. Furthermore, the Socialists blamed the attacks of the 1986–88 period on the economic policies of the previous government.
10. The concept 'epistemic community' is defined in Chapter 1; see n.6 above.
11. Several years later, during the discussions on EMU by the Delors Committee, the Bundesbank President Pöhl noted that 'the EMCF, which is tied to directives issued by the EC Council of Ministers and hence is subject to political instructions, is not suitable as a monetary authority for the Community' (Pohl 1989, 149; cited in Gros and Thygesen 1992, 21).
12. The first co-ordinated change of interest rates by the Bank of France and the Bundesbank, took place on 5 November 1987.
13. For example, Edouard Balladur, 'The EMS: advance or face retreat', *Financial Times*, 17.6.87.
14. Philippe Lagayette (1988) 'Les perspectives monétaires à l'horizon 1992', *Banque de France-Info*, no. 88–06, 14 March. Lagayette was a deputy governor of the Bank at the time.
15. Jean-Victor Louis, *et al.* (1989), 'Vers un système Européen de banques centrales', collection Etudes Européennes, Editions de l'Université de Bruxelles.
16. The governors of the central banks presented their final project of a statute of the ESCB and ECB on 9 April 1991 (*Agence Europe*, 10.4.91, 5468).
17. Karl-Otto Pohl (1989), 'The further development of the European Monetary System', in collection of papers annexed to Delors Report, Office of Publications of the European Communities, Luxembourg, 131–55.
18. Following the 1995 enlargement, this meant 11 out of 16 members.
19. The president was appointed to a three-year term by the 'common accord' of the heads of state or government, on a recommendation from the Committee of Governors/new EMI Council. Murray Doyle, the gover-

nor of the Bank of Ireland, was chosen as vice-president by the EMI Council.

20. As another compromise to assuage the wary Germans, at the Madrid December 1995 European Council the name of the European currency was changed from ECU – which the Germans thought sounded too French – to the more linguistically neutral euro.
21. The EMI's reports were decidedly more negative than those of the Commission, emphasizing the additional effort required in most member states to meet the convergence criteria. The publication of annual convergence reports was a treaty requirement (article 109j).
22. Of the countries that wanted to participate only Greece was deemed to have failed to have satisfied the convergence criteria. The EMI report ended years of speculation on Italian participation.
23. Dinan 2000, 477. Duisenberg subsequently announced on 31 December 1998 that he did not recognize, or intend to abide by, this compromise (ibid.).
24. Noyer, with no previous experience working in a central bank and not trained as a monetary economist, was a unique appointment to the ECB. Rather his background was typical of heads of the French Treasury: general training in public administration at the *Ecole Nationale d'Administration* and then in financial management in the Financial Inspectorate.
25. Hans Tietmeyer (1997) 'Der Euro: ein entnationalisiertes Geld', *Auszuege aus Pressartikeln*, 12 December (Frankfurt/Main: Deutsche Bundesbank). Author's translation.
26. 'Tietmeyer describes euro's slide as not good news', *Financial Times*, 6.5.01.
27. ibid.
28. Interviews with French Treasury officials and Michel Aglietta, a leading French monetary economist and consultant to the Bank of France (13 and 18.6.1994).
29. Reforms throughout the late 1970s, the financial deregulation of 1984 and European Competition rules substantially diminished this dependence. Aglietta (1988) claims that the relationship between the state and the central bank is not the real problem.

    > Monetary systems each have their own particular history. It is only in federal countries that central banks need to be independent of government. To create such a relationship in a highly centralized nation would be totally artificial and would not at any rate provide a real guarantee of anti-inflationary monetary policies, which is economic not juridical. What is essential is that the central bank is not the prisoner of a financial structure that requires it, under pain of destabilising this structure, to monetise public or private debts. It is the financial structure which must be transformed so that the central bank is not required to finance financial institutions. The policy must define the general conditions of the liquidity for all of the national economy. To achieve this judicial change is insufficient: what is needed is financial deregulation. This has been achieved in France. … The dependence that existed was not vis-à-vis government but rather a structural dependence which

limited the Bank of France's margin of manoeuvre. … The aim was to organize an open financial market in which the banks could lend without perturbing excessively the interest rates. … Internal deregulation and the raising of the external controls on capital movements go together (p. 19, author's translation).

30. It should be stressed that this favourable disposition ignored the potential economic policy implications of central bank independence. For a detailed description of the development of French public opinion in the pre-Maastricht period see the annual surveys in Sofres, *L'Etat de l'opinion*, Paris: Editions du Seuil, 1990–91; see also Corinne Balleix-Banerjee (1997) pp. 146ff.
31. For a copy of the French Draft Treaty see *Revue Financière Internationale: aujourd'hui l'écu*, *numéro spécial*, June 1991; and *Agence Europe*, 28/29.1.91, 5419. Much of the following information was also outlined by Treasury and Bérégovoy's support staff officials in interviews. See also Paul Fabra, *Le Monde*, 4.7.89. This also demonstrated the control exercised by Bérégovoy as leader of the French negotiating team during the IGC and the control of Treasury officials over the preparation of the Draft Treaty. Previously, Bérégovoy had struggled with Roland Dumas, the Minister of Foreign Affairs, in shaping the project (Dyson 1997, pp. 57–77; Aeschimann and Riché 1996; and Balleix-Banerjee 1997, pp. 332–54 and 372–7).
32. *Communiqué du Conseil des Ministres*, 5.12.90 and the French proposal for an EMU treaty, *Agence Europe*, 28/29.1.91, 5419.
33. *Agence Europe*, ibid., 5419.
34. The Dutch presidency presented a couple of texts (*Agence Europe*, 9.5.90, 5250) as did the Commission (*Agence Europe*, 18.5.90, 5257).
35. This involved the creation, at the start of Stage Two, of an ECB which would immediately begin emitting ECU (K. Dyson *et al*., 1994, p. 77). Support for this approach appears to have been based upon limited economic analysis and the French definitely underplayed its potential inflationary effects. Bérégovoy – who approached European affairs differently than Mitterrand – also wanted to continue British participation in monetary integration in order to further diminish German monetary power in Europe (Bauchard 1994).
36. *Agence Europe*, 13.4.91.
37. *Agence Europe*, 26.10.89, 5119.
38. In 1993, the Treasury fought a determined and public battle with Prime Minister Balladur, Minister of Finance Alphandéry and the Bank of France – which it lost – to assume direct control over banking supervision rather than allow the independent central bank to retain control. However, the Treasury made clear that its opposition to the Bank of France retaining this power did not indicate its hostility to the independence required in the context of the EMU project. See, for example, 'Banque de France: une liberté très surveillée', *Le Quotidien de Paris*, 6.4.1993.
39. Interview, 26.8.94.
40. This decision-making style is commented upon in great detail by Favier and Martin-Roland (1991) and Attali (1993, 1994, 1995).
41. However, at the same time, Mitterrand did not prevent de Larosière from publicly, and repeatedly, expressing his support for independence. See,

for example, de Larosière's speeches reprinted in *Banque de France-Info*, 89–24, 1.11.89, p. 8; and 90–12, 27.3.90, p. 7.

42. *Libération*, 4.9.92. Other leading Socialist politicians made similar claims.
43. Interviews with leading members of the Rocard and Cresson Governments and members of Bérégovoy's support staff.
44. For an analysis of Genscher's proposal from a French perspective see Aglietta (1988, pp. 14–19).
45. 'On n'est plus très loin du gouvernement économique', interview with Jean Lemierre in *Libération*, 13 January 1999. Jean Lemierre, former head of the French Treasury and the first president of the Economic and Financial Committee made such announcements to the French press upon the creation of the council at the start of 1999. The powers of the new Economic and Financial Committee do not reinforce those of the Euro-XI. Like the former Monetary Committee, this new body includes leading central bank officials and the Heads of national Treasuries. It incorporates the principal responsibilities of the former Monetary Committee, placing emphasis upon economic policy co-ordination (which explains the change in name). In June 1998, the Commission's proposals to strengthen economic policy co-ordination in the context of the new Committee and the Euro-XI, were rejected by the member states. Like its predecessor, the new Economics and Financial Committee is the principal body in which detailed negotiations and decisions take place, leaving ECOFIN to ratify the decisions or to negotiate and make decisions in those situations in which the treasury officials and bank governors are not able to reach agreement.
46. The Employment Chapter itself involved no additional spending or obligatory measures and emphasized a vision of job creation closer to that advocated by Tony Blair's New Labour – with an emphasis placed on training and the adaptability of the work force as contributing to a 'flexible and competitive Europe' – than the Plural Left vision of EU-level spending and intervention. The Luxembourg and Cardiff 'job summits' of November 1997 and March 1998, and the Cologne and Lisbon summits of June 1999 and March 2000 established and reinforced a programme of employment policy co-ordination: best practice information sharing, pilot projects and non-binding job creation targets. This co-ordination fell far short of the Jospin Government's initial proposals for the Luxembourg summit that included the establishment of specific binding national plans for the creation of 12 million jobs throughout the EU over the next five years, the co-ordination and regulation of employment policy at the EU-level and even the necessary Commission approval on industrial redundancies and closures ('Le Sommet de Tony Blair', *Le Monde*, 23–24 November, 1997).
47. See Martine Aubry's comments in 'Le Sommet de Tony Blair', *Le Monde*, (1997).
48. It should be noted that Finance Minister Fabius did not officially endorse this report.
49. Fabius, L., 'Donner plus de visibilité à l'euro 11 sera un axe fort de la présidence française'; Zecchini, L. and Lemaitre, P. H., 'La France veut renforcer le pouvoir du club de l'euro', *Le Monde*, 4 July (2001).

50. During the period between 1965 and 1988, the UK had an average inflation rate of 8.9 per cent and was ranked fifteenth out of the 18 OECD (Western industrialized) countries (Busch 1994: 59).
51. The pamphlet almost certainly had the blessing of Prime Minister Jospin, with an eye to the upcoming French presidential and National Assembly elections. Lamy and Pisani-Ferry likewise challenged the logic behind the continued application of the Stability Pact's 3 per cent budget deficit criterion.
52. Article 11.1 of the Statute of the European System of Central Banks (ESCB) allows the European Council to appoint as few as four Executive Board members.
53. Article 109l of the TEU, articles 44 to 47 of the ESCB Statute.
54. On payment systems, it can be noted that the EMI and the ECB have fought a hard battle to make these operational. The Target system was largely put in place by the EMI. However, well into Stage Three, there remained difficulties on retail cross border payment systems. A September 1999 ECB report ('Improving retail cross border payment systems – the Eurosystem's view') called on the banking to provide substantially improved services in this area by 2002 in order to create a 'single payment area in which people [were] able to transfer money as rapidly, reliably and cheaply from one part of the [Euro-Zone] to another as they can within each Member State'. Since the publication of the report the private banking sector has subscribed to the Eurosystem's objectives in principle and has cooperated with Eurosystem to identify the practical impediments to the achievement of these objectives and in order to investigate and where possible agree on effective solutions. However, by the summer of 2000, limited progress had been made which encouraged the ECB to prepare a progress report by autumn 2000 (ECB, 'Improving Cross-Border Retail Payment Services, Progress Report', September 2000). The ECB accepted that it would be unrealistic to expect the service level for cross-border payments to reach that of domestic payments in all respects by 2002 and that at present the Eurosystem would not become 'operationally active' on the matter. However, the ECB announced that, if sufficient progress had not been made by the time of the early 2002 progress report, the Eurosystem would step up the pressure on the banking sector to provide improve services.
55. The General Council has clarified the imposition of fines for failure to comply with obligations contained in ECB regulations and decisions in September 1999 and February 2000.
56. Since the transfer of power to the ECB, monetary aggregates have assumed greater significance in monetary policy-making than was previously the case with most EC central bank with the exception of the Bundesbank (Kenen 1995; 44). Their increased significance in part reflects the greater control the ECB possesses over the total money supply of Eurosystem countries than most EC central banks previously had over their own national money supplies.
57. These are: reserve transactions (applicable on the basis of repurchase agreements or collateralised loans); outright transactions; the issuance of

debt certificates; foreign exchange swaps and the collection of fixed-term deposits.

58. See also the speech by Wim Duisenberg at the conference organized by the De Nederlandsche Bank on the occasion of the 50th anniversary of Dutch bank supervisory legislation, Amsterdam, 24 April 2002 (http://www.ecb.int/).
59. Kenen (1995) cites in footnote 28 a central banker's optimistic comments on this matter:

    > I doubt that what has been agreed really excludes the ECB from involvement in supervision … and in the closing or restructuring of major institutions in difficulty. If there are systemic implications, the ECB is bound to be involved; it is surely inconceivable that the Governing Council will not discuss such operational questions if and when they arise; and although the Council does not have specific powers to instruct individual governors on such occasions, its general powers and responsibilities … will surely give it the necessary authority to exercise behind the scenes influence.

60. IMF, 'Report on Capital Markets', September 1998. The IMF report argues that the uncertainty generated by the present arrangements would entail new risks, including the possibility of investors requiring an additional risk premium at times of financial market volatility and, ultimately, of the credibility of EMU being damaged.
61. Padoa-Schioppa (1999) – among others including Kenen (1995; 34–5) – criticizes this criticism, arguing that it reflects an outdated notion of lender of last resort operations, underestimates the Eurosystem's capacity to act, and finally 'represents too mechanistic a view of how a crisis is, and should be, managed in practice'.
62. *Business Week* (2000), for example, pointed out one difference in opinion between two members of the Executive Board, Noyer and Issing. However, it was unclear whether in fact there was a substantive difference of opinion expressed or whether the difference was principally in the manner in which they summarized the position of the Governing Council.
63. However, there is a judicial mechanism for dismissing an individual member of the Executive Board in Article 11.4 of the protocol on the Statute of the ESCB: 'if a member of the Executive Board no longer fulfils the conditions required for the performance of his duties or if he has been guilty of serious misconduct, the Court of Justice may … compulsorily retire him'. Nonetheless, the onus rests with the Governing Council or the Executive Board of the ECB to apply to the ECJ on such matters.
64. These three types/modes of governance have been described by several authors. See Wessels and Linsenmann (2001).
65. There were efforts to clarify the contents of Article 109 in the Amsterdam Treaty. However, these efforts did not end the debate on the respective roles of the ECB and the Council in external monetary policy.
66. Dyson (2000, 197) and Padoan and Henning (2000) explore this point. The ECB's 'message is that states should be encouraged to put their own houses in order before seeking to engage in international economic coordination' (see Tietmeyer 1999b).

67. Kenen (1995; 190–1) argues that these arrangements should give the ECB 'some influence on the exchange rate policies of the nonparticipants' which, in turn, could gain some form of support from the ECB.
68. The respective roles of the EU institutions would also likely have ramifications in third countries with regard to the role of different institutions in relations with the EU and the Euro-Zone. Padoan and Henning (2000) argue that an increased future role of the ECB in international discussions and negotiations would have an impact upon the balance of power between the US Federal Reserve and Treasury Secretary. To the extent that the EU creates a full partner for the US Treasury in the form of a Council that is able to act, the present balance between the Treasury and Fed on external monetary policy can be preserved. If the Council cedes authority over external monetary policy to the ECB by default, the balance would probably shift toward the Fed.
69. The Euro-Zone, like the Eurosystem, has no legal personality and thus cannot negotiate and conclude public international law agreements or become a member of international organizations. The Euro-Zone must be represented externally by Community institutions or bodies which have a legal personality: ECOFIN, the ECB and, in accordance with an ECB decision, one or more NCB. Article 6.2 of the ESCB statute provides that the participation of Eurosystem's NCBs in international monetary institutions is subject to the approval of the ECB.
70. On 8 February 1999, Robert Raymond, former DG of the EMI, was appointed as the first ECB permanent representative in Washington DC with observer status at the IMF. On 9 September 1999, he was replaced by Gerald Grisse.
71. The difficulty of obtaining a unified position is due in part to the structure of representation of members of the IMF within the Executive Board constituency system, which separate Euro-Zone member states.
72. Protocol no. 1 to the OECD Convention was used as the legal basis for the decision on this matter.
73. See for example, Otmar Issing's speech on crisis prevention, 'IMF surveillance, need for new teeth', statement at the IMF conference on the role of the IMF in the world economy, 2 July 1998, Frankfurt.
74. Duisenberg (2000) defines coordination as the agreement between separate policy-makers to take and implement joint decisions.
75. Duisenberg quoted in 'Hard Money for a Softer Europe', *The New York Times*, 5 November 1998.
76. 'Europhoria fizzles out', *Financial Times*, 5 March 1999.
77. There exists considerable debate over the usefulness of using monetary aggregates such as M3. Alan Greenspan, the current chairman of the Federal Reserve admits that monetary aggregates are no longer a reliable guide for policy. The Bundesbank was one of last central banks to focus exclusively on the M3 money target. Some economists prefer to target nominal GDP (broadly speaking, the sum of inflation and real growth in output).
78. 'OECD report warns on ECB risks', *Financial Times*, 8 March 1999.
79. 'From the EMI to the ECB', Speech delivered by Wim Duisenberg, 30 May 2000. Published on the ECB's website (http://www.ecb.int/).

80. Through his comparison of the ECB to two other main paradigms of central banking independence, the US Federal Reserve System and the 'New Zealand model', Taylor (2000) offers proposals for strengthening the democratic and cooperative elements in the Maastricht model, while respecting the treaty constraints and the objectives of the key players.
81. Interviews were conducted at the ECB headquarters, Frankfurt/Main in June of 2000 and June of 2001.
82. Typically, no actor controls all of the instruments relevant to achieving particular goals. Thus, any actor's ability to reach his or her objectives depends to some degree on the actions of others – even if the actor's own choice of action is completely free. The effects of monetary policy actions are dependent in part on fiscal policy, bank regulatory policy, and events in the private sector, among other factors.
83. The ECB's first 'independence' casualty is Lafontaine who retired after only five months on the job. While internal SPD politics and the government's tax policies contributed to his decision, Lafontaine's ongoing battle with the ECB's President Wim Duisenberg certainly contributed to Lafontaine's decision to retire. See Chapter 6 for more on the Lafontaine–Duisenberg confrontation.
84. See the analysis, 'Hard Money for a Softer Europe', *The New York Times*, 5 November 1998.
85. ibid.
86. See, for example, Duisenberg's testimony in front of the European Parliament's Sub-Committee on Monetary Affairs, 18 January, 1999 (www.ecb.int).
87. See also Tony Barber, 'Inside the ECB: Consensus and Europeanism rule', *Financial Times*, 22 October 1999.
88. See the analysis in 'Euro-Towers or Faulty Towers', the *Economist*, 31 October 1998.
89. One can argue that budgetary independence (i.e. freedom from the need to get legislative approval of the central bank's operating budget) should also be considered. Although it may be important in some countries, the issue of operating budgets has not emerged a source of contention.
90. Although not codified in treaty, in the last analysis the ECB, through the national central banks, must cover the financial requirements of a government that cannot be met from other sources. For further discussion, see Buiter (1999: 201–2).
91. See the comments of Treasury Assistant Secretary for International Affairs Edwin Truman, 'US Official in attack on Euro-Zone policy', *Financial Times*, 8 April 1999.
92. We do not include a detailed separate analysis of the Bundesbank here, but use the Bundesbank as a baseline model of a historically independent central bank. See Loedel (1999a) for a more detailed analysis.
93. See the analysis of the *Economist*, 'Ready or not, here comes EMU', 11 October 1997.
94. See the comments of Wim Duisenberg, 'Monetary Policy in the EMU', *Auszüge aus Presseartikeln*, December 2 1997.
95. 'Euro-Wechselkurspolitik lässt Fragen offen', *Finanz-und Wirtschaftsspiegel*, 15 December 1997.

97. 'Banker with Euro vision', the *Observer*, 1.23.00
98. 'ECB to try to avoid shocks', *Financial Times*, 29 June 1998. The inaugural meeting of the ECB was held on 9 June, 1998 in Frankfurt Germany.
99. 'Rates in the Euro-Zone will be "higher than expected"' *Financial Times*, 22 July 1998. The ECB set its target rate for M3 growth at 4.5 per cent on an annual basis.
100. Wolfgang Münchau, 'Europe's fragile recovery', *Financial Times*, 29 July 1998.
101. 'ECB cracks the whip', *Financial Times*, 10 July 1998.
102. It should be noted that the ECB was also involved in controversy over its selection of the two-pillar monetary strategy as well as its decision to impose higher than expected reserve requirements. While more of technical debate among economists and bankers, the ECB was well within its power and discretion to make these decisions. These issues are detailed in Chapter 4.
103. 'Interest Rates cut in Europe', *Washington Post*, 4 December 1998.
104. 'European Rate Cuts Explained and Applauded', *This Week in Germany*, 11 December 1998.

106. Quote from a member of the ECB Governing Council. Interview with the author, June 2000, Frankfurt/Main.
107. 'Clear skies viewed from the euro tower', *Financial Times*, 5 January 1999.
108. 'Wir reagieren nicht auf politischen Druck', *Frankfurter Allgemeine Zeitung*, 2 January 1999.
109. 'Mehr Transparenz in der Geldpolitik', *Handelsblatt*, 20 January 1999.
110. Interview with a German banker, June 2000, Munich, Germany.
111. Such a view was confirmed in interviews with the ECB. Frankfurt/Main, June 2000.
112. 'Euro-Zone may win credibility back under Prodi regime', *Financial Times*, 6 April 1999.
113. The ECB was also dealing with the aftershocks of the publication of a sensationalistic insider account of the ECB's activities and personalities, written by Matt Marshall (1999), a US journalist. The book's suggestions that some leading ECB officials were not at all in favor of EMU and wavered in their early support of EMU did harm to the euro's value and the perception of the ECB's credibility in the public's eye.
114. 'Learning the hard way', *Financial Times*, 30 April 1999.
115. ibid.
116. 'Weakness is a strength', *Financial Times*, 2 April 1999.
117. See her interview, 'Mangel an Vertrauen konnte Erfolg des Euros gefahrden', *Handelsblatt*, 19 February 1999.
118. 'Diese Ökonomen irren gewältig', *Wirtschaftswoche*, 27 May 1999.
119. 'EU leaders fail to project unity on euro policy', *Financial Times*, 5/6 June 1999.
120. Interview with the ECB, June 2000, Frankfurt/Main.
121. 'Discordant notes spoil performance', *Financial Times*, 25 October 1999.
